5.2.6 KEY SCAN Board	161
5.2.7 POWER Board	162
Chapter six BOM List	164

Chapter One About Maintenance

1.1 Safety precautions

1.1.1 Power supply

When maintenance personnel are repairing DVD players, he should pay special attention to the power board with 220V AC and 330V DC which will cause hurt and damage to persons!

1.1.2 Precautions for antistatic

Movement and friction will both bring static electricity which causes serious damages to integrated IC. Though static charge is little, when a limited quantity of electric charge is added to large-scale integrated IC, as the capacitance is very small in the meantime, now the integrated IC is very much easy to be struck through by static electricity or the performance will decrease. Thus static electricity prevention is of extraordinary importance. The following are several measures to prevent static electricity:

1. Use a piece of electric conduction metal with the length of about 2 metres to insert into the earth, and Fetch the lead wire from the top of the surplus metal and connect to the required static electricity device. The length and depth of the metal embedded under the earth should be determined according to the wettability of the local soil. For humid places, it may be shorter, and longer and deeper for dry places. If possible, it can be distributed and layed in terms of “#” shape.

2. On operating table-board, the antistatic table cushion should be covered and grounded.

3. All devices and equipments should be placed on the antistatic table cushion and grounded.

4. Maintenance personnel should wear antistatic wrist ring which should be grounded.

5. Places around the operating position should also be covered with electric conduction cushion or Painted with antistatic paint.

1.1.3 Precautions for laser head

1. Do not stare at laser head directly, for laser emission will occur when laser head is working, which will Hurt your eyes!

2. Do not use wiping water or alcohol to clean laser head, and you may use cotton swab.

1.1.4 About placement position

1. Never place DVD player in positions with high temperature and humidity.
2. Avoid placing near high magnetic fields, such as loudspeaker or magnet.
3. Positions for placement should be stable and secure.

1.2 Maintenance method

1.2.1 Visualized method

Directly view whether abnormalities of collision, lack of element, joint welding, shedding welding, rosin joint, copper foil turning up, lead wire disconnection and elements burning up among pins of elements appear. Check power supply of the machine and then use hands to touch the casing of part of elements and check whether they are hot to judge the trouble spot. You should pay more attention when using this method to check in high voltage parts.

1.2.2 Electric resistance method

Set the multimeter in resistance position and test whether the numerical value of resistance of each point in the circuit has difference from the normal value to judge the trouble spot. But in the circuit the tested numerical value of resistance is not accurate, and the tested numerical value of integrated IC's pins can only be used for reference, so the elements should be broken down for test.

1.2.3 Voltage method

Voltage method is relatively convenient, quick and accurate. Set the multimeter in voltage position and test power supply voltage of the player and voltage of a certain point to judge the trouble spot according to the tested voltage variation.

1.2.4 Current method

Set the multimeter in current position and test current of the player of a certain point to judge the trouble spot. But when testing in current method, the multimeter should be series connected in the circuit, which makes this method too trivial and troublesome, so it is less frequently used in reality.

1.2.5 Cutting method

Cutting method should be combined with electric resistance method and voltage method to use. This method is mainly used in phenomena of short circuit and current leakage of the circuit. When cutting the input terminal voltage of a certain level, if voltage of the player rises again, it means that the trouble lies in this level.

1.2.6 Element substitution method

When some elements cannot be judged good or bad, substitution method may be adopted directly.

1.2.7 Comparison method

A same good PC board is usually used to test the correct voltage and waveform. Compared these data with those tested through fault PC board, the cause of troubles may be found.

Through the above maintenance method, theoretical knowledge and maintenance experience, all difficulties and troubles will be readily solved.

1.3 Required device for maintenance

- ◆ Digital oscillograph ($\geq 100\text{MHz}$)
- ◆ TV set
- ◆ SMD rework station
- ◆ Multimeter
- ◆ Soldering iron
- ◆ Pointed-month pincers
- ◆ Cutting nippers
- ◆ Forceps
- ◆ Electric screw driver
- ◆ Terminals connecting cord
- ◆ Headphone
- ◆ Microphone

Chapter Two

Functions and Operation Instructions

2.1 Features

- # Utilizes MPEG-II Real-Time encoding and decoding technology, capable of directly recording TV and external program sources on to DVD+R, DVD+ RW discs
- # Capable of recording your favorite video tapes into DVD
- # Built-in DV (i. LINK/IEEE1394) input jack enables high fidelity digital recording of digital video camera signals
- # Progressive scan capable of producing stable and clear pictures without flickering,
- # Built-in 5.1CH Dolby Digital surround decoder, separate 5.1CH outputs, 2CH Dolby outputs, optical and coaxial outputs for digital audio
- # 24bit audio DAC capable of producing perfect acoustic fidelity
- # With normal DVD playback function, capable of playing DVD, SVCD, VCD, CD, MP3, JPEG, DivX DVD+R and DVD+RW discs
- # Recorded discs playable on normal DVD players
- # Capable of recording up to 6 hours of video on single-sided discs DVD+R/DVD+RW (4.7GB)
- # Supports 4 recording modes: HQ, SP, EP, SLP
- # OTR function enables one-touch recording, convenient to select the length of recording time
- # Manual/automatic insertion of chapter mark
- # Features chapter hiding, disc locking to the recorded discs (DVD+RW) and titles renaming
- # Title index pictures of recorded disc (DVD+RW) are freely selectable
- # Multi-dubbing, multi-angle, multi-subtitle for selection
- # Built-in TV tuner with automatic channel scanning
- # AV input S-Video, DV (i. LINK/IEEE1394) and antenna input conveniently located on both the front and rear panels, to record various program sources
- # Supports composite video, component/progressive-scan video output terminals and TV antenna output terminals
- # Built-in USB jack, capable of playing JPEG, MP3 file
- # Intelligent preset timer recording function makes you won't miss any wonderful programs
- # Recording and output system supports both PAL/NTSC systems
- # Wide range of operating power supply: ~100V—240V, 50/60Hz, standby power consumption \leq 3W
- # Intelligent software upgrading capability
- # Dual SCART: one for input, another for output
- # Dual Kara OK function

2.2 BASIC INFORMATION

2.2.1 Illustration of the Front Panel

- ① STANDBY indicator
 - ② STANDBY/ON button
 - ③ MICPHONE 1
 - ④ MICPHONE 2
 - ⑤ VOL KNOB
 - ⑥ Disc tray
 - ⑦ OPEN/CLOSE button
 - ⑧ Infrared remote sensor
 - ⑨ VFD display window
 - ⑩ PLAY button
 - ⑪ PAUSE button
 - ⑫ STOP button
 - ⑬ REC button
 - ⑭ SOURCE button
 - ⑮ CH+button
 - ⑯ CH- button
 - ⑰ USB input terminal
 - ⑱ DV input terminal
 - ⑳ Front AV input terminal
- protection cover here

The function of buttons on the front panel is the same with that of the corresponding ones on the remote control.

The input terminals on the front panel can only be seen when the protection cover is opened

2.2.2 Illustration of the Rear Panel

- ① TV TUNER input terminal
The antenna cable plug is inserted here
- ② TV TUNER output terminal
This terminal is directly connected with the TV TUNER Input Terminal inside this unit
- ③ Rear COMPOSITE Video input terminal
- ④ Rear S-Video input terminal
- ⑤ L/R channel audio input terminals
- ⑥ 5.1CH output terminals
- ⑦ L/R channel audio output terminal
- ⑧ COMPOSITE VIDEO out terminal
- ⑨ S-VIDEO output terminal
- ⑩ COMPONENT VIDEO output terminal
- ⑪ COAXIAL output terminal
- ⑫ OPTICAL output terminal
- ⑬ CVBS/ RGB and audio output terminal
- ⑭ CVBS and audio input terminal

2.2.3 Illustration of the VFD

The look of VFD is shown as the following figure:

2.2.5 Accessories

One Mini-DV cable

One 75 Ω TV coaxial cable

Two audio/video cables

One remote control

Two AAA batteries

One warranty card

One owner's manual

2.3 SYSTEM SETUP

In order to satisfy different kinds of consumers and because of the outfits with different performance, this unit is equipped with various functions. You can proceed the system setup to meet your needs and cooperate with your outfits. Certainly you may use the default settings to satisfy your basic requirements .

2.3.1 Operation Interface and General Steps

This section introduces the operation interface and general steps of the system setup.

1.Press [SETUP] button to enter system setup mode. Then the TV screen displays the system setup control menu, which is shown in the following:

- # If the system displays "  ", it means the System Setup mode cannot be entered in current mode, so please exit this mode first.
- # The meanings of the icons are as follows:

- 1 General setup
- 2 Playback setup
- 3 Record setup
- 4 Language setup
- 5 Channel Scan
- 6 Date, Time setup

2.Select the desired item on the control bar by [5], [6] buttons, and then press [SELECT] button to enter the corresponding setup submenu .

3.In the submenu , operate the relative controllers by direct buttons and [SELECT] button to fulfill the corresponding setup.

4.Press [RETURN] button to return to the previous menu, or press [SETUP] button to exit

Notes

- # The steps above are general operations. Some setup may not need a certain step, or need more steps.
- # Please proceed the system setup in tray out

or no disc status, otherwise some setup may not be proceeded.

2.3.2 General Setup

- 1.Enter the system setup mode.
- 2.Select the item "  " in the system setup control menu by [5],[6] buttons.
- 3.Press [SELECT] button to enter the general setup submenu, which is shown as the right figure.

General Setup Menu

2.3.3 Screen Saver Setup

The screen saver function is that an interesting screen saver picture appears on the screen automatically,when this unit's video output signal has no change(that is the image on the TV screen has no change)for a certain time.

- 1.In the general setup menu, move the cursor to select item "Screen saver" by [5], [6] buttons.
 - 2.Press [SELECT] button , then a pop-up list will be displayed , which is shown as the right figure.
 - 3.Move the cursor up and down to select "ON" or "OFF" by [5], [6] buttons.
 - 4.Press [SELECT] button to turn on or turn off the screen saver function.
- # Pressing any button can exit the screen saver mode after the screen saver picture appears.
 - # The screen saver function is invalid when playing Mp3and CD-DA Disc.

2.3.4 Progressive / Interlaced Setup

- 1.In the general setup menu, use [5], [6] buttons to select "Progressive / Interlaced" item and press [SELECT] button, then a list will appear.
- 2.Select "Progressive" or "Interlaced".
- 3.Press[SELECT]button to fulfill theProgressive/ Interlaced switch.

4. You can also keep on pressing [IS/PS] button for 3 seconds to perform the Progressive / Interlaced switching.

The value of this setting must accord with the scanning mode of the TV, otherwise the TV screen will display Nothing.

If nothing is shown on the TV screen, you may try to keep on pressing [IS/PS] button for 3 seconds.

To avoid instability of output signal, please don't perform " Progressive/Interlace " function by component(Y,Cb/Pb, Cr/Pr) terminal on the rear panel when "SCART output" item is RGB.

2.3.5 SCART Output Setup

1. In general setup menu, highlight "SCART output", and press [SELECT] button, and then a list will appear.

2. Select "YCbCr" or "RGB" in the list.

When using component video output, please select "YCbCr".

When using SCART output, you may select according to the fact. But you had better select the "RGB".

This setup does not affect the composite video output.

3. Press [SELECT] button to confirm.

2.3.6 Video Output Format Setup

This unit has two video output systems: PAL and NTSC. You can select one of them according to your TV set specs.

1. Highlight "Video output format" in the general setup menu and press [SELECT] button. A pop-up menu will appear.

2. Select the proper option according to factual

requirements.

3. Press [SELECT] button, and then the system will switch the output format to what you select right now.

You can switch the TV output format by pressing the [PAL/NTSC] button too.

Changing the output format may cause no picture on the TV screen. If this happens, you can press [PAL/NTSC] button to restore the output format.

2.3.7 Restore Factory Settings

1. Select "Restore factory setting" by [5], [6] buttons in the general setup menu, then press [SELECT] button, and the TV screen displays:

2. Highlight "OK" in the menu by [3], [4] buttons.

3. Press [SELECT] button to make all setup items restore the factory settings.

When your unit is in abnormal working mode, it is probably caused by your wrong setup. Please try the "Restore Factory Settings" operation to make it work normally.

2.3.8 Playback Settings

1. Display the system setup control menu.

2. Move the cursor by [5], [6] buttons to select " " item.

3. Press [SELECT] button to enter the playback setup mode. The right figure is the main menu of playback setup.

the main menu of playback setup

2.3.9 TV Aspect Ratio

- In the playback setup menu, select item "TV aspect ratio" by [5], [6] buttons, press [SELECT] button and then the value list will appear, which is shown as the right figure.
- Select the suitable value by using [5], [6] buttons, and then press [SELECT] button.
The meaning of each value to be selected of this item is as follows:
16 : 9: Applicable to wide screen TV set.
Pan Scan: Suitable for the common size TV set. When playing wide screen pictures, left and right edges of the original pictures are cut off. The picture will be displayed to full screen.
Letter Box: Suitable for the common size TV set. When playing wide screen pictures, black banners will appear on the top and bottom of the TV set.
- Press [RETURN] button to return to the previous menu and proceed other settings.

Notes

- # The playback effect is related to the playing disc. If a disc is recorded in the aspect ratio of 4:3, the ratio can only be 4:3, no matter which screen setting you select.
- # This setting should conform to the aspect ratio of the TV set.

2.3.10 Rating Level Setup

By setting this unit's authorization rating and password, some discs with control grade cannot be played without inputting the password. In this way, you can confine the children to watch the disc unsuitable to them.

- In the playback setup menu, move the cursor up and down by [], [] buttons to select the item "Rating level", and then press [SELECT] button. The TV screen displays:

- Input the password and press [SELECT] button. If the password is right, the TV screen displays the window shown as the right figure. The super password is 3308.

- Select "Set rating level", and press [SELECT] button to display the pop-up list which is shown

- Select the rating level by [5], [6] buttons and press [SELECT] button to confirm.
- If you do not want to change the original password, highlight the "OK" in the menu through cursor buttons and then press [SELECT] button.
- To change the password, please highlight the "New" in the above figure and press [SELECT] button. Now the TV screen will display:

- Select "New password" by the cursor buttons and input the new password by number buttons.
- Select "Confirm password" by the cursor buttons and input this password again by number buttons.
The input password in the "New password" must accord with that in the "Confirm password".
- Highlight "OK" by cursor buttons and then press [SELECT] button.
After setting the rating level, when playing the disc with the rating level higher than what you have set, you must input the password.
If you forget the password, you may input the super password.

2.3.11 Digital Audio Output Setup

This unit has digital audio output jacks. So you can enjoy the higher quality audio with an amplifier with digital audio decoders.

1. Access the playback setup menu. Select item "Digital audio output" by [5], [6] buttons, and then press [SELECT] button. A list will pop up:
 2. Select the proper value by [5], [6]
- # RAW : This unit doesn't perform
LPCM: This unit performs decoding

2.3.12 Analog Audio Output Setup

This setting is used to select an analog audio output format between 2CH analog mix audio output and Dolby 5.1 CH analog output.

1. Select "Analog audio output" item by [5], [6] buttons, and press [SELECT] button, then a pop-up list will appear:
2. Select the desired value by [5], [6] buttons then press [SELECT] button to confirm.

2.3.13 Record Setup

After finishing the settings introduced in this chapter, when recording, the values you set will become the default values of the correlative items.

1. In the system setup control menu, select item " " by [5], [6] buttons and then press [SELECT] button to enter record setup menu. The screen displays:

the record setup menu

Note

- # If the TV screen displays " ", when pressing [5]/[6] button, it may indicate that the current activated menu will not be the system setup control menu. Please press [RETURN] button once or more to activate the system setup control menu.

2.3.14 Auto Chapter Marker Setup

1. In the record setup menu, select item "Auto chapter marker" by [5], [6] buttons, press [SELECT] button, and then a pop-up menu will appear:
 2. Select the proper value by [5], [6] buttons, and then press [SELECT] button to confirm.
- # This setup is used to make sure whether insert the chapter marker automatically when recording.
- # If you don't set this item to "OFF", the recorded contents will be automatically divided into some chapters with the same length according to the interval time you've selected.

2.3.15 Default Input Signal Sources Selection

1. In the record setup menu, select "Default source" by [5], [6] buttons and press [SELECT] button, then a pop-up menu will appear:
2. Select the desired value by [5], [6] buttons and then press [SELECT] button.

- # There are several groups of input source ports. Please refer to the "Basic Information—Illustration of the Front/Rear Panel" for their position on the unit.
- # Front CVBS: Front panel composite video and audio inputs.

Rear CVBS: Rear panel composite video and audio inputs.

Rear S-VIDEO: Rear panel S-video and audio inputs.

DV: Front panel DV input.

SCART: Rear panel CVBS and audio inputs.

TUNER: Rear panel TV tuner input.

2.3.16 Default Recording Quality Selection

1. In the record setup menu, select item "Default quality" by [5], [6] buttons, press [SELECT] button, and then a list menu will appear.

2. Select the desired value by [5], [6] buttons, and then press [SELECT] button.

Please refer to the "TERMS" for the four different recording qualities: SP, SLP, EP, HQ.

2.3.17 Language Setup

To meet the needs of consumers in different regions, this unit is equipped with many kinds of operation interface languages for your selection.

1. Enter the system setup mode.

2. In the system setup control bar, move the cursor by [5], [6] buttons. Select item

"", and then press [SELECT] button to enter the language setup menu. The screen displays:

the language setup menu

2.3.18 OSD Language Setup

1. In the language setup menu, select item "OSD language" by [5], [6] buttons, press [SELECT] button, and then a list will pop up, which is shown as the following figure:

2. Select your desired language by [5], [6] buttons, press [SELECT] button to confirm, and then the OSD language will change correspondingly.

2.3.19 DVD Menu Language Setup

1. In language setup menu, select item "Menu language" by [5], [6] buttons, press [SELECT] button, and then a list will pop up, which is shown as the following figure.

2. Select your desired language by [5],[6] buttons, and then press [SELECT] button.

If you play the DVD discs that support the selected language, the system will adopt this language as the DVD menu Language.

If the disc does not support the selected language, the system will use the language supported by the disc.

2.3.20 DVD Subtitle Language Setup

Some DVD discs have many kinds of subtitle languages and this setup is used to set the default DVD subtitle language.

1. In the language setup menu, select item "Subtitle language" by [5], [6] buttons, press [SELECT] button, and then a list will pop up, which is shown as the following figure:

2. Select your desired language by [5], [6] buttons, and then press [SELECT] .

"OFF" means closing the subtitle output.

The system will select this setup language as the DVD subtitle language preferentially. If the DVD discs you select do not support this language, this setup is invalid.

You may change the subtitle language at random when playing. Please refer to "Playback mode" for details.

2.3.21 DVD AUDIO Language Setup

1. In the language setup menu, select item "Audio language" by [5], [6] buttons, press [SELECT] button, and then a list menu will pop up, which is shown as the following figure.
 2. Select your desired language by [5], [6] buttons, and then press [SELECT] button.
- # The system will use the setup language as the DVD output language preferentially. If the disc does not support this setup, the setup is invalid.
- # When playing DVD discs, you may change the output language at random. Please refer to "Playback Mode" for details.

Notes

- # About the DVD language setup introduced in this chapter, some discs have not the language you set, so the setup will be invalid. When playing, the relative languages are the corresponding ones provided by the discs.
- # For some DVD discs, when playing, it will display the language selection menu. If you perform the selection in it, the corresponding setup of this unit will be invalid, and the relative languages are the ones you select.

2.3.22 Channel Tuning

This unit is equipped with a TV tuner, by which you can receive TV signals. Before receiving TV signals, you must proceed tuning operation. The result of the operation will be saved and will not be lost after this unit is switched off. This operation can tune this unit automatically to receive the TV programs.

1. In the System Setup Control menu, highlight item "  " by [5], [6] buttons.
2. Press [SELECT] button, then the SYSTEM SETUP-CHANNEL SCAN menu will appear, as shown in the following figure.

2.3.23 Auto Scan Channels

1. Highlight item "Scan channels", and press [SELECT] button to start channel scanning.
- # You can press [STOP] button to stop the scanning during the operation. If do so, the channel information having been obtained during scanning can also be saved.
- # When scanning a channel, the TV will show the image of this channel's program.

Note

- # Before the channel scan operation, you must connect the system properly to ensure the TV signals can enter the system through the "TV TUNER input" jack. Please refer to "System Connection-System Connection of Recording External Signals" for the connection illustration.

2.3.24 Modify channel Information

Here, you can name the channel after the corresponding program's name or any other name you like, sort the channel order to access the special channel easily, tune the channel finely, and scan the channel manually. You can manage the channels more easily, and make this unit receive the TV signal better by these operations introduced in this section.

1. Highlight item "Modify channel information" in "SYSTEM SETUP-CHANNEL SCAN" menu, and press [SELECT] button, then the "Channel Edit" menu will appear, as shown in the right figure:
- # If this unit have not scanned some programs, the "Channel Edit" menu can not be displayed.
2. Select the desired channel to modify by pressing [CH+] / [CH-] button.

2.3.25 Modify Channel Information (CONTINUED)

3. Change the Channel name: Highlight the "Name" item, press [SELECT] button, and then the right window of the same line will become input status shown as the following figure.

Move the cursor to a character by [3], [4] buttons, and then change the character by [5], [6] buttons. When finishing changing all the characters, press [SELECT] button to confirm.

The changing sequence of the character when pressing [5] button is as following:

When pressing [6] button the sequence is reverse.

4. Change TV system: Highlight the item "TV system", and press [SELECT] button to display the drop down list. Select proper value, and then press [SELECT] button to confirm.

The value of the TV system must match the received TV signal. If it is not right, the system will not receive the program's sound signal. So you should select the right value.

5. Manual Scan Channels:

A. Select a channel number by pressing [CH+], [CH-] buttons.

B. According to the demands of the local TV system, set items "TV system" by the methods described in step 4.

C. Highlight "Frequency" item in the "Channel Edit" menu by [5],[6] buttons, and press [3]/[4] button, then the system shall start scanning channels.

If you press [4] button, the system shall forward scan channels from the current frequency.

If you press [3] button, the system shall backward scan channels from the current frequency.

When encountering a channel with TV program, the scanning will stop.

D. When the scanning ending, that is, encountering a channel with

TV program, press [SELECT] button, then the TV program signal shall be correlated with the current channel number & name, that is the current channel number & name represents this TV program.

6. Skip a channel: Highlight the item "skip", and press [SELECT] button to display the drop down list. Select "YES" or "NO", and then press [SELECT] button to confirm.

If you select "YES", and when receiving TV programs, this channel can not be received, as if it does not exist.

7. Channel Fine Tuning: Highlight item "Fine tune" in the "Channel Edit" menu. Then you can start fine tuning the channel.

After finishing the channel scanning, maybe some channels' frequency is not adjusted to right value. In this way, when watching these channels, the image and sound will be misty. Then you should perform channel fine tuning to right adjust these channels' frequency.

2.3.26 Modify Channel Information(CONTINUED)

Pressing [3] button once can decrease the frequency.

Pressing [4] button once can increase the frequency.

When changing the frequency, the definition of the image or sound will be changed correspondingly, then from this, you can know the effect of the fine tuning.

8. Close/Open NICAM functions: Highlight the item "NICAM", and press [SELECT] button to display the drop down list. Select "ON" or "OFF" from the list, and then press [SELECT] button to confirm.

The so-called NICAM functions include stereo function and dual dubbings function. When "NICAM" item is "ON", if the received TV program supports stereo function, this unit will output the stereo dubbing; on the other hand, if the received TV program supports dual dubbings function, you can select one of the two dubbings as output by item "System Setup-Channel Scan- Channel audio language". Of course, if you set "NICAM" to "OFF" or receive TV program without NICAM function, the above functions are invalid.

9. Switch channel audio language: when receiving the TV programs supporting dual dubbings functions, you can select one of the two dubbings as output by this item.

- A. Highlight item "Audio" in the "Channel Edit" menu, and then press [SELECT] button to pop up a submenu list.
- B. Select "DUAL A" or "DUAL B" in the list, and then press [SELECT] button to confirm.

- # You must open the NICAM function first, otherwise this function will be invalid. Please refer to step 8 in section "Modify Channel Information" to open the NICAM function.
- # The value "DUAL A" or "DUAL B" stands for one of the two dubbings. If the received TV program can not support dual dubbing function, the above operations shall not influence the output dubbing.
- # You can select "DUAL A" or "DUAL B" by [AUDIO] button in the remote control when not in "CHANNEL EDIT" menu.

2.3.27 Sort Channel Order

1. Highlight item "Sort channel order", and press [SELECT] button, then a corresponding menu will appear, as shown in the right figure.
- # If this unit has not scanned some programs, the "Sort channel order" menu can not be displayed.

2. Highlight the desired channel in the left list window by cursor buttons, and press [SELECT] button, then the channel name will appear in the right list window, shown as the right figure.

3. Move the channel name up and down by [5],[6]

button to select the right position where you want to insert this channel.

4. Press [SELECT] button to insert the channel name to the selected position in the left list window, as shown in the right figure.
5. Press [RETURN] button to return to the previous menu and proceed other settings.

2.3.28 System Clock Setup

1. Enter the system setup mode.
2. In the system setup control menu, move the cursor to select item "1" by [5], [6] buttons, and then press [SELECT] button, so the TV screen will display the time setup window, which is shown as the right figure.

2.3.29 System Clock Setup (CONTINUED)

3. Select item "Date (dd/mm / yy)" and make it in input mode. Highlight a number by [3], [4] buttons, and change it by [5],[6] buttons. After inputting the date by sequence of "date/month/year", press [SELECT] to confirm.

4. Select item "Time (hh: mm: ss)" and make it in input mode. Highlight a number by [3],[4] buttons, and change it by [5],[6] buttons. After inputting the time by sequence of "hh:mm:ss", press [SELECT] to confirm.

The correct setup of system clock is the precondition of time recording.

2.4 RECORDING MODE

2.4.1 Summarization

This unit has various external input signal terminals including S-video input, composite video input, TV tuner input, DV input, SCART input and stereo audio input. You can record any group of these video and audio input signals.

The recordable discs of this unit are DVD+RW and DVD+R. There are four recording qualities to be selected, including SLP (about 6 hours), EP (about 4 hours), SP (about 2 hours) and HQ (about 1 hour).

This unit also incorporates time recording function with which you can prepare a record schedule before-hand and it will record your desired programs according to the schedule on time.

2.4.2 How to Receive the TV Program

1. Connect the system according to the figure shown in section "System Connections - Connecting to the TV set".
2. Connect the power plugs of the TV and this unit to the outlet.
3. Switch the TV set to AV mode, and turn on this unit by pressing the [STANDBY/ON] button.
4. Press the [SETUP] button to enter the System Setup mode, and then perform the Channel Scanning and Channel Fine Tuning according to the steps introduced in chapter "System Setup - Channel Tuning". After finishing, please press [SETUP] button to exit setup mode.

Before receiving TV programs for the first time, you must do this step, this unit will save corresponding information after you have done it.

5. According to the method described in section "Viewing the Input Source", select the TV input source to view.
6. Press [CH+]/[CH-] to switch the TV program.

2.4.3 Viewing the Input Source

You can let the input source signal be shown directly on the TV screen. By this function you can get a preview of the external signals for more rightly selecting the desired signal.

1. Please connect the system according to "System Connections-System Connection of Recording External Signals".

Make the source equipment work properly, and let it output the signal intended for recording.

2. There are three ways for selecting the signal to view.

A. Pressing [SOURCE] button can directly view the external signals one by one. The sequence of viewing the external signal is shown in the following.

B. When this unit is playing a title of a DVD+RW disc, after pressing [SOURCE] button, a warning message window will appear as shown in the following figure.

Please press [SELECT] button, and then select the signal you want by method in point a

C. Press [NAVIGATION] button once or twice to display the record control menu. Select "SOURCE" item by [5], [6] button, then press [SELECT] button to display the source drop down list as shown in the following figure. Select the desired source from the list, and press [SELECT] button, then the TV screen will show the corresponding picture.

Record control menu

Notes

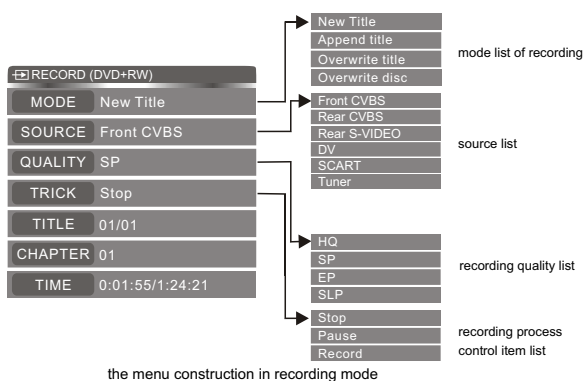

In the above three ways, if the system displays " " , it means viewing the input source can not be realized in the current mode, so please press [RETURN] button once or more times to quit the current mode, then perform the corresponding operations again.

When the unit is recording, if you want to view the external signals, you must stop the recording first.

2.4.4 Manual Recording

The following figure shows the construction of the menu in recording mode.

The last three items can not be controlled in this mode, but you can learn some information by them. Please follow the following steps to finish a recording task.

1. Make sure an unfinalized DVD+R or DVD+RW disc has been in the disc tray.
 2. Select the desired external signal source to be recorded according to the way in section "Viewing the Input Source".
 3. Press [NAVIGATION] button to display the record control menu.
 4. Refer to the menu construction figure, rightly set the values of "MODE" and "QUALITY". You can refer to following contents to realize this step.
- # Highlight the desired menu item by [5], [6] buttons, pop out the submenu by [4] or [SELECT] button, and confirm by [SELECT] button.
- # Meanings of some values in the submenu are as follow:

2.4.5 Manual Recording (CONTINUED)

MODE

New title: Add a new title when recording.

Append title: Append the recording content to the last title, and does not add a new title.

Overwrite title: When you perform this order by method **a** as follow, this unit will overwrite the current title from current point as a new title. In this situation, the recording will stop automatically when meeting the end of the current title. If you press [STOP] button before the recording stops automatically, the remanent part of the current title will turn into another new title. When you perform this order by method **b** as follow, this unit will overwrite the current title from the beginning of the current title, and the recording will stop automatically when meeting the end of the current title. If you press [STOP]

Button before the recording stops automatically, the remanent part of the current title will turn into another new title.

Overwrite disc: When you perform this order by method **a** as follow, this unit will overwrite the disc from current point as a new title. In this situation, the recording won't stop until you press [STOP] button. If an existed title doesn't be overwritten totally after you press [STOP] button, the remanent of the current title will turn into another new title. When you perform this order by method **b** as follow, this unit will overwrite the disc from the beginning of the current title. In this situation, the recording won't stop until you press [STOP] button. If an existed title doesn't be overwritten totally after you press [STOP] button, the remanent of the current title will turn into another new title.

Notes

In some situations, "Overwrite title" and "Overwrite disc" may be invalid. To make it valid, there are two ways as follow:

- A. When selecting the desired external signal **5** source in step **2** described above, make sure that the Step **b** in section "Viewing the Input Source" has been done. Then please perform steps **3**, **4** and **5**.
- B. After the unit has read an unempty DVD+RW disc, select an unempty title by [5],[6] button then press [4] button to display the control menu. From it, select "Overwrite title" or "Overwrite disc" item by [5],[6] button and press [SELECT] button to confirm. Then please perform steps **3**, **4** and **5**.

SOURCE

- Front CVBS :** Front panel composite Video and audio inputs
- Rear CVBS :** Rear panel composite video And audio inputs
- Rear S-VIDEO :** Rear panel S-video and audio Inputs
- DV :** Front panel DV input
- SCART :** Rear panel CVBS and audio Inputs
- Tuner :** Rear panel TV turner input, please select the TV program By [CH+],[CH-] buttons.

Notes

The source value must match the port through which the external source signal is inputted.

QUALITY

HQ: perfect quality, a single-side DVD disc can record about one hour program.

SP: standard play, a single-side DVD disc can record about two hours program.

EP: extend play, a single-side DVD disc can record about four hours program.

SLP: standard long play, a single-side DVD disc can record about six hours program.

YRICK

Stop : Stop the recording

Pause : Pause the recording

Record : Start recording

5. After finishing the steps described above, please set item "TRICK" to "Record", then press [SELECT] button to start recording. While recording, you can pause or stop recording by setting item "TRICK" to the corresponding value. Certainly, you can more conveniently realize these control by pressing [RECORD], [PAUSE] and [STOP] buttons.

2.4.6 One Touch Recording (OTR)

This function can make you set the end time of the recording. When the time is up, the recording will stop automatically.

1. Enter the recording mode and start recording.

2. According to the desired time, press the [RECORD] button once or more.

Pressing [RECORD] button once, the length of the recording time will extend for 15 minutes (≤ 60 minutes) or 30 minutes (>60 minutes). If it exceeds the disc recordable time, the system will cancel OTR function and switch to normal recording mode.

If the OTR process is paused or stopped, the system will cancel the OTR.

2.4.7 To Control the DV Camera Recorder by this Unit

This unit may control the DV camera recorder through the 1394 serial interface, that is, when using DV as input source, you may fulfill the operations of playback, pause, etc. to the DV through the remote control of this unit.

1. Properly connect the DV (Please refer to "System Connection of Recording External Signals" for details) and make it work normally. Then set the "Source" item in the control menu bar of this unit to "DV".

2. When pressing the [STOP] button, if this unit is in recording mode, the recording will stop and the DV can not be influenced, on the other

hand, if the unit is not in recording mode, this unit can not be influenced and the DV will stop.

This operation can make the recording control bar disappear.

3. Pressing the [PLAY] button doesn't influence this unit, but can make the DV switch to normal playback. When pressing [PAUSE / STEP] button, if this unit is in recording mode, the recording will pause and the DV can not be influenced; on the other hand, if the unit is not in recording mode, it can not be influenced and the DV will pause.

This operation can make the recording control bar disappear.

5. When pressing the [REW] button, the DV will play fast backward. If this unit is in recording mode, the recording will pause.

This operation can make the recording control bar disappear.

6. When pressing the [FWD] button, the DV will play fast forward. If this unit is in recording mode, the recording will pause.

This operation can make the recording control bar disappear.

Notes

Do not shake this unit or unplug it when recording.

A finalized DVD+R disc cannot be used to record.

If you want to play the recorded disc in normal player, you should perform the operation of Finalizing or Making Compatible. Please refer to "Disc Operation" for details.

2.5 TIMER TASK SETTING MODE

2.5.1 Summarization

This function can make this unit record automatically according to the preset requirements when the preset time is coming. And it will resume the original mode after finishing the recording. To carry out this function, you should set down a record schedule first and then finish the configuring of the system according to the requirements on the schedule. If you are busy and unwilling to miss any wonderful program, this unit can satisfy your requirements.

Operation Steps

1. Press the [TIMER] button to display the record scheduler menu shown as the following figure.

Highlighting any non-empty note by cursor buttons, and then pressing [ADD/CLEAR] button, can delete it.

2. Press [SELECT] button, then the TV screen will display the Item Editor window as shown in the following figure.

Performing the relative setting in this Item Editor window can make a record Scheduler.

the Item Editor window

3. Setting the input source: Press [SELECT] button to display the drop down list, then select the right item from the list by [5],[6] buttons. At last, press [SELECT] button to confirm.

Please refer to "System Setup -Record Settings - Default Input Signal Sources Selection " for the values of the " Source" Item.

For example, if you want to record the Ch003 TV program, you may set the value of the Source item to Ch003.

2.5.2 Operation Steps (CONTINUED)

Highlight "Quality" item by [5],[6] buttons, and press [SELECT] button to display the drop down list, select the right value from the list, and then press [SELECT] button to confirm.

As for the recording quality, please refer to "Basic Information -Terms" for details.

5. Setting recording date

You can perform this setting at the third row in the "Item Editor". Move the cursor to select this row and press [SELECT] button, then a list will pop up. It is shown as follows:

From this illustration, we can learn that this pop up list has six options. Their meanings are as follows:

- # ONCE: record at a certain time
- # DAILY: record once per day
- # WEEKLY: record once per week
- # Mon~Fri: record once per day from Monday to Friday
- # Mon~Sat: record once per day from Monday to Saturday
- # Sat~Sun: record once per day from Saturday to Sunday

A. If you select "ONCE", after confirming by [SELECT] button, move cursor by [6] button and press [SELECT] button to make the next row into input mode, then input the date in sequence of "date/month/year". Finally press [SELECT] button to Confirm.

When the date input window is in input mode, you can select a number by [3], [4] buttons, then press [5]/[6] button to change it.

B. If you select "DAILY"/"Mon~Fri"/"Mon~Sat"/"Sat~Sun", you only need to press [SELECT] button to confirm. And then the TV screen will display the following figure.

C.If you select "WEEKLY", after confirming by [SELECT] button, move cursor by [6] button and press [SELECT] button to display the weekday list, then select what you need from the list.

2.5.3 Operation Steps (CONTINUED)

6.Setting the start time of recording.Select the "Start" item by [5], [6] buttons in the "Item Editor" and press [SELECT] button to make it in input mode, as shown in the right figure. Input the time between 00:00~23:59 by number buttons, then press [SELECT] button to confirm.

Highlighting a number by [3], [4] buttons, and then pressing[5], [6] buttons can change the number.

7.Setting the end time of recording. The operation is similar to that in step 6 .

The meaning of this setting is that when the finish time is up, the recording will be over and the unit will resume to the original mode before recording.

If the record time (from the start time to the End time) is too long,an error message window will appear on the button of the screen, and you can not perform the following steps. And then you need to set the "Start" time and "End" time again.

8.After every parameter of the time recording is

well set, please highlight the "OK" button in the "Item Editor" , and press [SELECT] button to finish the setup.

9.Set another timer recording task or press [TIMER] button to quit the record schedule menu.

10.After finishing setting the recording schedule, collocate the system according to the requirements in the recording schedule and make this unit in standby or working mode.

In 3 minutes before recording, if the unit is working normally, a message dialogue will appear to require whether it starts to record. If the recording conditions are satisfied, please highlight the "OK" button on the dialogue and press [SELECT] button to confirm.

If this dialogue is not managed, the system will think you are agree to record. After a moment, it will start recording.

If the system is in standby mode, it will automatically switch on and enter the recording mode in about 1 minutes before recording, and then start recording.

After the recording is finished, the system automatically enters the standby mode.

Notes

This unit can't perform two or more timer record tasks at the same time.

Before timer recording, you must set the system time & date (refer to "System Setup-System Clock Setup" for details) properly, otherwise, this function introduced in this chapter will not be implemented.

The system must be properly collocated to fulfill the schedule recording task.

Do not use the finalized DVD+R disc.

After finishing recording a DVD+RW/ DVD +R disc, you may play it in this unit, then you can do some operations on it to make it more easy to use. When loading this disc, the TV screen will display the following picture. Each little icon in the picture stands for a title, the right words and numbers indicate some information of the title. Their meanings are as follows:

a.Title name, and "Title" is the default name.

b.The date of recording this title.

c.The time of recording this title

D.The record quality and length of the title

The following descriptions will tell you how to do when meeting this picture.

The start picture when playing DVD+R/RW disc recorded by this unit (Title list)

2.5.7 Rename Title

1.Highlight a title icon you want to rename in the Title List and press [4] button, then a menu will pop up as shown in the right figure.

2.Highlight "Rename title" item, and press [SELECT] button, then a key board menu will pop up.

- The meanings and operations of the controller in the key board menu are as follows:
- # Title Name Editing window
 - # Characters area: select a certain key in this area by using cursor buttons, and then press the [SELECT] button. The letter on the key will appear in the Title Name Editing window.
 - # Space: blank button by which you can insert a blank to title name.
 - # Caps: selecting this key and pressing the [SELECT] button can make the letters in the Characters area switch between the capitalization and the common letterform.
 - # BkSp: selecting this key and pressing the [SELECT] button can cancel the letter before the cursor in the Title Name Editing window, meanwhile the cursor backs a space.
 - # Delete: selecting this key and pressing the [SELECT] button can cancel the letter after the cursor in the Title Name Editing window.
 - # Clear: selecting this key and pressing the [SELECT] button can clear all the letters in the Title Name Editing window.
 - # Exit: selecting this key and pressing the [SELECT] button can exit this menu and keep

2.5.4 To Browse the Contents of the Disc and Select one Title to Play

- 1.Roll up and down the title list picture by [5], [6] buttons to browse all the titles.
- 2.Highlight a title icon you desire to play by [5], [6] buttons, then press [SELECT] button to play it.
- 3.During playing, you can press [TITLE] button to switch the TV screen picture to Title List to select another title to play.

2.5.5 Erasing Title

- 1.Highlight a title icon you want to delete in the Title List picture and press [4] button, then a menu will pop up as shown in the right figure.
- 2.Highlight "Erase title" item, and press [SELECT] button, then the system will erase this title.

2.5.6 Edit Title

This operation can switch the system to edit mode. The functions and operations for edit mode are described at the next chapter.

- 1.Highlight a title icon you want to edit in the title List picture and press [4] button, then a menu will pop up as shown in the right figure.
- 2.Highlight "Edit title" item, and press [SELECT] button, then the system will enter edit mode.
- 3.Then, refer to chapter "Editing Mode" to perform corresponding operations.
- 4.To exit, please press [EDIT] button first and wait a few seconds until system operation is finished.

the Title Index name unchanged.

OK: selecting this key and pressing the [SELECT] button can exit this menu, meanwhile change the Title Index to the one in title Name Editing window.

3.Type a new title name in the Title Name Editing window by the keyboard in the menu.

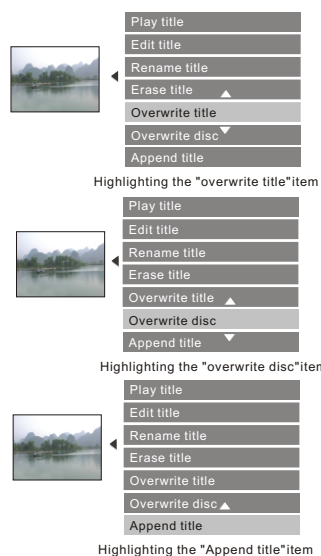

4.Select the "OK" key and press the [SELECT] button to fulfill the naming to the title.

2.5.8 Overwrite Title / Append Title / Overwrite Disc

"Overwrite title", "Append title" and "Overwrite disc" are three kinds of record mode. The meaning about them is introduced in section "RECORDING MODE --Manual Recording--MODE". If you have connected the external signal to this unit, you can select one of them to perform recording.

1.Highlight a title icon you want to overwrite and press [4] button to display the menu.

2.Highlight "Overwrite title" item, " Append title" item or "Overwrite disc" item, then press [SELECT] button to confirm.please note that you can see "Append title" item only in menu of the last title.

2.6 EDITING MODE

2.6.1 Summarization

For the recorded disc, the dividing of the title and chapter can't match your fancy. The index icon and name of each title are confirmed by the system, which are not striking, not beautiful, not convenient to skim over the disc, and not possible to meet your personalized enjoyment either. The edit function is set for getting over the above limitations.

2.6.2 Entering the Editing Mode

When the disc in the loader is DVD+R/RW and the system is not in the mode of writing or erasing, pressing the [EDIT] button can enter the edit mode and display the control menu.

Notes

When " " appears while you press the [EDIT] button, it may indicate that the DVD+RW disc in the loader has been write protected, or the system in current mode can not enter the editing mode. You can perform the disc operation to cancel the write-protect or exit current mode.

2.6.3 Menu Explanation

The editing control menu is shown in the

- Title : the left of the number beside the icon is the current title number, and the right is the total of the titles in the disc.
- Chapter : the left of the number beside the icon is the current chapter number, and the right is the total of the chapters in the disc.
- Play : this item can perform the following functions: Play, Pause, Fast forward, Slow forward, and Step.
- Chapter marker : separate or combine the chapters.
- Hide/Unhide chapter: display or skip the chapter when playing it.
- Index picture : change the index icon .
- Split title : divide current title to 2 titles at current point.
- T-Elapsed: can not be controlled, showing the elapsed time.

2.6.4 Operation Steps

Selecting the Title/Chapter to be Edited

- Enter the editing mode
- Select the Title/Chapter item by using [5], [6] buttons in the editing control menu.

2.6.5 Selecting the Title /Chapter to be Edited (CONTINUED)

- Press [SELECT] button to make the Title/Chapter item in input mode.

- Input the number of the Title/Chapter to be edited by using number buttons, and press [SELECT] button, then the system starts to play the selected title or the one which the selected chapter belongs to repeatedly.

2.6.6 Insert Chapter Marker

- In the edit control menu, move the cursor by [5], [6] buttons to highlight the "Chapter marker" item, then press [4] / [SELECT] button to display the value list shown as the following figure.

- Select proper value from the list by [5], [6] buttons, and press [SELECT] button to confirm, then the system will start separating or combining the current chapter.
- # If you select "Delete marker", this chapter and the former chapter will be combined to one chapter.
 - # If you select "Insert marker", this chapter will be separated into two at the current location.
 - # If you select "Delete all markers", all chapters of this title will be combined into one chapter.

2.6.7 Hiding / Unhiding Chapter

- In the edit control menu, move the cursor by [5], [6] buttons to select the Chapter Hide/Unhide item.
 - Press the [SELECT] button to switch the value of this item.
- # If the value is "Hide chapter", this chapter will be played when playing in normal mode.
 - # If the value is "Unhide chapter", this chapter will be skipped when playing in normal mode.

Notes

- # This operation is invalid to DVD+R.

2.6.8 Changing the Index Picture

When entering the DVD title menu (Press the [TITLE] button when playing), the title index will be shown on the screen as a little icon, standing for a title (Please refer to "Playback Mode"). The method of changing the title index is introduced in the following.

- In the edit control menu, move the cursor by [5], [6] buttons to select the "Index picture" item.
- Now, please watch the playing picture carefully, when meeting a picture you like, you can press [SELECT] button to replace that title icon by that picture.

2.6.9 Split Title

- Highlight the "Split title" item in edit control menu, shown as the following figure, then press [SELECT] button.
- # The operation will divide current title to 2 titles at current point, and it will occupy many time, please wait for a moment.

Notes

- # This operation is invalid to DVD+R disc.

2.6.10 Exiting the Editing Mode

- Press [EDIT] button to exit this mode.
- # When exiting, the system will write some information into the disc, so the unit will stop responding for a while.

2.7 DISC OPERATION MODE

2.7.1 Summarization

The disc operations refer to some operations about the disc in the loader, including viewing the disc information, finalizing

a disc, erasing the disc content, erasing the title, lock/unlock the disc and so on.

2.7.2 Entering the Disc Operation Mode

If you load unfinalizing DVD+R or DVD+RW disc, you can enter this mode. There are two ways to enter this mode.

1. During playing, you can enter this mode by [DISC OPER] button. After entering the mode, please press [4] button to display the control main menu, as shown in the following figures.

2. Display Title List picture by the methods introduced at chapter "Playing and Processing the Disc Recorded by this Unit", and press [5] button continuously until the icon  appears, then press [4] button.

2.7.3 Operations

Play: Highlight item "Play" in the menu, and then press [SELECT] button.

Rename disc:

Highlight item "Rename disc", and press [SELECT] button, then a keyboard menu will appear. By the keyboard, you can rename the disc through the methods introduced in chapter "Playing and Processing the Disc Recorded by this Unit".

Finalize disc/Make compatible :

the key board menu by which you can rename the disc

"Finalize disc" is valid for DVD+R disc. If do this, the disc can be played in normal DVD player, but can't record new contents. "Make compatible" is valid for DVD+RW disc. These operations can make the disc able to be played in normal player. Highlight item "Finalize disc" and press [SELECT] button, then a dialogue will open shown as the right figure, please highlight "Ok" key in the dialogue, then press [SELECT] button to start this operation.

◆ These operations will occupy some time, Please wait for a few minutes.

"Make compatible" can appear if you make "Insert Maker" operation according to the method in section "EDIT MODE -Insert Chapter Maker".

Lock disc: "Lock disc" is valid for DVD+RW. This operation can protect the recorded contents from being deleted. If you want to record new contents in the disc, you must unlock the disc. You can highlight item "Lock disc" and press [SELECT] button to lock or unlock the disc. If the disc is locked, this operation will unlock the disc, otherwise it will lock it.

Erase disc: This operation is only available for DVD+RW disc. Highlight item "Erase disc" and press [SELECT] button, then the system will start erasing disc contents. This operation will occupy many time. When erasing, any other operations can not be proceeded, including standby. Once the operation starts, it cannot be cancelled midway. Please do not unplug the unit midway. Otherwise, the disc will be probably damaged.

Record a new title / Overwrite disc: These operations can perform recording function. "Record a new title" can add a new title when recording, and "overwrite disc" can overwrite all the contents in the disc as new one. You can highlight "Record a new title" or "Overwrite disc" item, and press [SELECT] button to start recording.

2.7.4 Exiting the Disc Operation Mode

1. Press [DISC OPER] again to exit.

2.8 PLAYBACK MODE

2.8.1 Entering the Playback Mode

In the playback mode, this unit is totally the same as a high quality DVD player. The way to enter the playback mode is as follows:

1. Connect this unit with the TV set (Refer to "System Connection" for details), turn on the TV set and switch it to the AV input mode.

2. Plug in the unit, then press [STANDBY / ON] button to turn it on.
 3. Press [OPEN / CLOSE] button to open the disc tray.
 4. Load the disc correctly as shown in the illustration.
 5. Press [OPEN / CLOSE] button to close the disc tray, then the system starts playing.
- # According to different discs, the system will probably enter the Title Selecting Playback mode or Menu Playback mode. If this condition appears, the disc will not be continued playing (please refer to the following text).
6. If system is in other working mode, please press [PLAY] button to enter the playback mode.
 7. If you press [PLAY] button, the TV screen displays " " . Please exit current working mode first, and then press [PLAY] button again.
- # When writing or erasing, pressing [PLAY] button will be invalid.
- # If there is no disc in the loader or load the disc that this unit doesn't support or has been damaged badly, pressing [PLAY] button will be invalid.

2.8.2 Playback from the Menu

Displayed

1. When playing a DVD disc, it will enter menu playing mode. The menus of different discs are different. In general, you can select the playing language, set the subtitle language and so on by that menu. To perform some operations, you only need to highlight the corresponding item by cursor buttons and confirm by [SELECT] button.
2. When playing some VCD disc, these menus will be a list of tracks. You can select a track by number or cursor buttons, then press [SELECT] button to play the selected track.
3. During playing, you can open the disc menu by pressing [MENU] button. Of course, all the functions about the disc menu can be fulfilled by the corresponding control menu based on this unit.

2.8.3 Playback from the Titles

Displayed

This operation is only available for the DVD disc. During playing, if you want to select some title to play, you can press [TITLE] button. Then the screen will display the title icons list, shown

as the right figure. You can highlight an icon you like, then press [SELECT] button to play it.

Notes

- # The title menu of different DVD discs may be different.
- # Not all DVD discs have title menu. For some DVD discs without title menu, pressing [TITLE] button is invalid.

2.8.4 Ending Playback

- # This unit enters the pre-stop mode.
 - # In this pre-stop mode, this unit automatically memorizes the pre-stop point. If you press [PLAY] button, this unit will resume the playback from the pre-stop point (Playback starts from the beginning of the pre-stopped track for MP3). If you press [STOP] button twice, this unit will enter stop mode and the memory is cleared.
2. Press [OPEN/CLOSE] button to eject the tray.
 3. Take the disc out.
 4. Press [OPEN/CLOSE] button to retract the disc tray.
 5. Press [STANDBY/ON] button to end the operation.

Note

- # If the disc is badly damaged or loaded incorrectly, the OSD will display "NO DISC".

2.8.5 Playing Mode Control

1. Press [NAVIGATION] button twice to open the main control menu.
2. Highlight "MODE" item by [5], [6] buttons, and press [SELECT]/[4] button to display the drop down list window shown as the right figure.
3. Select one value in the list, then press [SELECT] button to confirm. The meanings of the values are as the following:

1. BIRNAK	Sequence Playback
2. A-B	A-B Playback
3. C-RPT	Segment Repeat Playback
4. T-RPT	Title Repeat Playback
5. D-RPT	Disc Repeat Playback
6. TR-RPT	Track Repeat Playback

- 7.PROG Program Playback
- 8.RANDOM Random Playback

The list values are different when playing different discs.

For most operations, if you perform step ③, things are over, but if you select "A-B Repeat" and "Program", you shall perform the following steps.

4. If you select "A-B Repeat", when pressing [SELECT] button, the menu becomes the style shown as the right figure. You need to set the B point. Press [SELECT] button to display Mode value list again and select "A-B Repeat". Now, please wait, and when meeting your desired point, you can press [SELECT] button to set the B point.

During your waiting, the main control menu will disappear. You also can press [NAVIGATION] button to hide the menu.

5. If you select "Program" in step ③, the following list windows will pop up.

By this menu you can select your favorite contents from the disc to play in your pointed sequence.

2.8.6 Playing Mode Control (CONTINUED)

You can control the two list windows by the following points.

- # Move the cursor between left window and right window by [], [] buttons.
- # Move the cursor up and down in one of the windows by [], [] buttons.
- # Highlighting an item in left window, then

pressing [ADD/CLEAR] button can add the item to right list window.

Highlighting an item in right window, then pressing [ADD/CLEAR] button can delete the item

If the items of the left window is title, you can expand item by pressing [SELECT] button, shown as the following figure:

6. Add your favorite contents to right window in your desired sequence according to the above description, then move the cursor to the right window and press [SELECT] button to start program playback.

2.8.7 Playback Process Control

1. Press [NAVIGATION] button twice to open the main control menu.
2. Highlight "TRICK" item by [5], [6] buttons, and press [SELECT]/[4] button to pop out the drop down list window shown as the right figure.
3. Select one value in the list, then press [SELECT] button to confirm.

The means of the List values are as following:

- ① PLAY playback
- ② STOP stop
- ③ PreSTOP prestop
- ④ PAUSE pause
- ⑤ FastForward2~32 fast playback, the number shows the speed of the playback
- ⑥ FastBackward2~32 fast backward playback, the number shows the speed of the backward Playback
- ⑦ SlowForward1/2~1/16 slow playback, the fraction shows the degree of slow Playback

The list values are different when playing different disc.

2.8.8 Title/Chapter/Track Selection

1. Press [NAVIGATION] button twice to open the main control menu.
2. Highlight "Title"/"Chapter"/"Track" (for VCD/SVCD) item, and press [SELECT] button to make it in input mode.
3. Enter your desired number by number buttons, and press [SELECT] button, then the system will start playing the selected Title/Chapter/Track.

The left part of the item value is the number of current playing content; the right one is the total number.

2.8.9 Audio / Subtitle Selection

1. Press [NAVIGATION] button twice to open the main control menu.
2. Highlight "AUDIO"/"SUBTITLE" item by [5], [6] buttons, then press [SELECT]/[4] button to open the drop down list shown as the right figure.

3. Select one value in the list, and then press [SELECT] button to confirm.

The values of the lists are based on the played disc

For DVD disc, the values of audio list will be DOLBY, DTS and so on.

For VCD/SVCD, the values of audio list will be STEREO, LEFT and RIGHT.

The settings of these items also can be done in DVD menus. The initial value of the two items can be set in System Setup.

2.8.10 Angle Selection

1. Press [NAVIGATION] button twice to open the main control menu.
 2. Highlight "ANGLE" item by [5], [6] buttons, and press [SELECT] button to make it in input mode.
- # The right side of the numbers beside the icon is the total angle number of this disc ; the left is the current angle number.
3. Input the ANGLE number you need by number buttons, and press [SELECT] button to confirm.

2.8.11 PBC ON/OFF

1. Press [NAVIGATION] button twice to display the main control menu.
2. Highlight "PBC" item by [5], [6] buttons, and then press [SELECT]/[4] button to display the drop down list window shown as the right figure.
3. Select "ON" or "OFF" from the list, and then press [SELECT] button.
4. Pressing [MENU] button also can make the PBC on or off.

Notes

- # The PBC function refers to the menu playback function of the VCD 2.0 disc. When the PBC is on, the TV screen displays a list of all the tracks. You can select any track by number buttons on the remote control, and press [SELECT] button to play from the selected track. During the playing, if you want to play the other track, you need to press [MENU] button to display the track list, and select another track by number buttons then press [SELECT] button to confirm. When the PBC is off, the system plays the disc contents in sequence.

Not all the VCD discs can proceed PBC playback.

2.8.12 T-Time/Tr-Time Display

1. Press [NAVIGATION] button twice to display the main control menu.

- 2.Highlight "T-Time" (For DVD) or "Tr-Time"(For VCD/SVCD) item by [5], [6] buttons, and then press [SELECT] button to open the drop down list shown as the right figure.
 - 3.Select your desired item by [5], [6] buttons, then press [SELECT] button to confirm.
- # In DVD playing mode, it includes "TITLE" and "CHAPTER" , in VCD/SVCD playing mode, it includes "DISC" and "TRACK".
- # The left part of the item values is the elapsed time of the title/track, the right one is the remain time.

2.8.13 The Operations of Function Buttons

Most of the operations in playing mode can be done by menu or function buttons, some operations only can be done by menu, and other operations only can be done by function buttons.

- 1.REPEAT button - Repeat playback
Press [REPEAT] button repeatedly, and the playing mode will be circularly switched in the following sequence:

- 2.FWD button - Forward playback Press [FWD] button repeatedly, and the playing speed will be changed in the following sequence:

- 3.REW button - backward playback Press [REW] button repeatedly, and the backward playing speed will be changed in the following sequence:

4.SKIP button

- A.If you press the [⏭] button on the remote control, the system goes forward into the next chapter (to DVD) or track (to VCD) and begins playback
- B.If you press the [⏮] button on the remote control, the system goes backward into the previous chapter (to DVD) or track (to VCD) and begins playback.

- 5.PAUSE/STEP button - Pause playback & playing frame by frame.

- A.When playing the valid disc , if you press [PAUSE/STEP] button, the playback will pause.
 - B.If you press [PAUSE/STEP] button again, the picture goes forward a frame.
 - C.If you press [PLAY] button, the system will enter normal playback.
- # Pressing the [PAUSE] button the second time means normal playback when playing CD-DA and MP3 discs.

6.VOL+/VOL-/MUTE button - Volume control

- A.If you press [MUTE] button, the system has or hasn't audio output.
- B.If you press the [VOL+] button, the volume increases.
- C.If you press the [VOL-] button, the volume decreases.

7.GOTO button - Switching the mode of selection playing

- A.In the playback mode, you can press [GOTO] button to highlight different select item circularly in the playback control menu. You can input the corresponding values by using the remote control with the method aforesaid.
- # The illustration below is the example of playing the DVD disc. It is similar to other discs.

- # Pressing [GOTO] button is invalid to some discs.

- B.When play disc (as JPEG/MP3/DivX disc) with directory structure, you must press [GOTO] button to confirm instead of pressing [SELECT] button.

- # In directory structure, to go to corresponding directory, you need press [GOTO] button once and input the number of the directory then press [GOTO] button again to confirm. Press [SELECT]button to open it.

- # In file structure, to go to corresponding file and start playing it, please operate according to the method in " directory structure " .

- # In playing MP3/DivX file, to go to some time position of current file and start playing, at first press [GOTO] button twice and input the number your desired then press [GOTO] button again to confirm.

2.8.14 Playing JPEG/MP3/CD/DivX Disc

Operation

When loading disc with directory structure, the TV screen will display the disc content list and favourite/programlist windows as shown in the following figure. From this you can do selection playback or program playback.

- 1.Highlight your desired file or directory by [5], [6] buttons, and then press [SELECT] button.
- # If the highlight item is file, the system will start playing it.
- # If the highlight item is directory, the system will expand its contents.
- # To return to previous menu, please press [RETURN] button. If you press [ADD/CLEAR] button, the highlighted file item will be added to the right list window, then you can do program playback by the following steps.

- 2.Select your desired content from left list window by [5], [6] buttons and add it to right list window by pressing [ADD/CLEAR] buttons.
- 3.Move the cursor to the right list window by [4] button and press [SELECT] button, then the system starts playing the contents of the right list window one by one.
- # Highlighting the item in right list window by [5], [6] buttons and pressing [ADD/CLEAR] button can delete it.
- 4.When you play JPEG/DivX file, please press [<] button to return to previous menu.

2.8.15 Playback Control Menu

Loaded a disc with directory structure or playing a file like JPEG/MP3/CD/DivX, you can display the playback control menu by pressing [NAVIGATION] button once or twice. You can do some operation to current file by the playback control menu. The playback control menu will be different when playing different type disc.

When playing MP3/CD When playing JPEG When playing DivX

The means of the list values are as following:

- 1.Type: display current playback type AUDIO - Playing MP3/CD

PIC - playing JPEG

VIDEO - playing DivX

- 2.MODE: please refer to " Playback Mode - Playing Mode Control " for submenu content.
- 3.TRICK: please refer to " Playback Mode - Playback Process Control " for submenu content
- 4.AUDIO: you can select different audio channel output (stereo/left/right),you can also do it by press [AUDIO] button repeatedly.
- 5.TIME: you can select displaying elapsed time or remain time.
- 6.WIPE: please refer to " Playback Mode - Control Wipe Mode when Playing JPEG Disc " .
- 7.ZOOM: please refer to " Playback Mode - Control Zoom Mode when Playing JPEG Disc " .
- 8.ROTATE: please refer to " Picture Rotating when Playing JPEG Disc " .
- 9.LANG: if the disc include several kinds of language, you can select desired language from this item.

Notes

- # Some discs labelled with MPEG4 on the market actually are *.rm/*.ra/*.ram/*.rmm others,with which are incompatible. Please take care when buying discs.

2.8.16 Control Wipe Mode when Playing JPEG Disc

In general, many pictures will be saved in the disc as the JPEG file format. When playing this disc, the pictures will be shown on the screen one by one. You can select the mode of the picture switching.

- 1.Playing a JPEG file, press [NAVIGATION] button twice to display the playback control menu.
- 2.In the playback control menu, select the Control Wipe Mode item by [5], [6] buttons, and then press [SELECT] button to display the wipe mode list shown as the right figure.
- 3.Select the desired mode of the picture switching from the list by [5], [6] buttons and then press [SELECT] button.
- 4.Press [NAVIGATION] button to return to the previous menu.

2.8.17 Control Zoom Mode when Playing JPEG Disc

This function can zoom in or zoom out the picture to facilitate your watching.

1. Playing a JPEG file, press [NAVIGATION] button twice to display the playback control menu.
2. In the playback control menu, select the Control Zoom Mode item by [5], [6] buttons, and then press [SELECT] button to display the zoom mode list shown as the right figure.
3. Select the percentage of zoom from the list by [5], [6] buttons, and then press [SELECT] button.
The value of "FITSCREEN" means the full screen display.
4. Press [NAVIGATION] button to return to the previous menu.

2.8.18 Picture Rotating when Playing JPEG Disc

This function can change the angle of the placement of the picture on the screen to facilitate your enjoying.

1. Playing a JPEG file, press [NAVIGATION] button twice to display the playback control menu.
2. Select the Picture Rotating Select item in the playback control menu by [5], [6] buttons, and then press [SELECT] button to display the rotating value list shown as the right figure.
There are four kinds of rotating angles: 0°, 90°, 180°, 270°
3. Select the desired angle from the list by [5], [6] buttons and then press [SELECT] button.
4. Press [NAVIGATION] button to return to the previous menu.

2.9 USB MODE

2.9.1 Summarization

This unit is equipped with an USB socket, then the equipment with USB socket(e.g.DV,DC,Mp3 Player, Flash Driver, USB Hub, USB Card reader) can be connected to this unit.

This unit only supports such file formats in USB device: JPEG,MP3 and WMA.

Only when the other file format is translated to one supported by this unit, can it be played.

2.9.2 Operations

1. Insert the USB device to the USB socket in this unit.
2. Plug in this unit, and then turn it on by button [STANDBY/ON].
3. Press button [USB/DVD] to enter the mode of reading USB.
4. When playing the files in USB, please perform the corresponding operations according to chapters: "Playback Mode - Playing JPEG/ MP3/CD Disc", "Control Wipe Mode when playing JPEG Disc", "Control Zoom Mode when Playing JPEG Disc" and "Picture Rotating when Playing JPEG Disc".

2.9.3 Exiting the USB mode

Press button [SOURCE] or [USB/DVD] to exit the USB mode.

Note:

This unit can not support all the USB devices of DV, DC, MP3 Player, Flash Driver, USB Hub, and USB Card reader in the market. We list some USB devices passing the test in this unit for your use reference.

Table 1

USB card reader model \ CARD model	CF	MD (micro Drive)	SD	MMC	MS	XD	SM
USB 2.0(NEQ ND3260)	PASS	PASS	PASS	PASS	PASS	PASS	PASS
Zynet 8 in 1 USB 2.0(NEQ ND3260)	PASS	PASS	PASS	PASS	PASS	X	PASS
PQ 7 IN 1,USB flash 1.1(SI)	PASS	PASS	PASS	PASS	PASS	X	PASS
No branch 8 in 1,USB 1.1(ALCORAu9632)	PASS	N/A	PASS	PASS	N/A	PASS	PASS

---------	----------------	---------------------------------	--

Note

USB refers to Universal Serial Bus. Most of USB devices on the market are USB1.1 or USB2.0. There are some types USB 1.1 devices: Monitors, Communication devices, Audio, Human input, Mass storage.

Most FLASH MEMORY, MP3 Player, USB HDD ect. belong to MASS storage Class. Mass storage Class include 2 transport manners:

1. USB 1.1 Mass Storage Class Control/Bulk/Interrupt (CBI) Transport
2. USB 1.1 Mass Storage Class Bulk-Only Transport

This unit support USB 1.1 Mass Storage Class Bulk-Only Transport, we are not sure that other USB devices can be supported! So please find out about the features of USB equipments before buy.

When use USB 1.1 Mass Storage Class Bulk-Only Transport devices, please notice the file operation system support Windows FAT, not support FAT32 and NTFS ect. file system.

Chapter Three Unit Circuit Principle

Section One Principle of the Player

DW9918K is a DVD disc playing and recording player that integrates playing and recording together, which supports DVD-R DVD-RW DVD+R DVD+RW format record disc, and plays DVD/CD/MP3 format discs. This player is composed by decode board, loader, AV board, power board and main panel.

Decode board: it is the main part of the player, which includes decode chip, audio/video D/A conversion and FLASH/SDRAM module, etc. The main function is fulfil the decompression of data during the course of playing to reconvert signals conveyed by loader into analog audio/video signals; and responsible to converse analog audio/video signals to digital signal and perform decoding to send to the player during the course of recording; and also control the system of the working of the player.

Loader components: includes loader laser head, frame and servo board. This loader adopts ATAPI jack, with strong applicability, which may read DVD, CD format discs and support the write function of DVD-R DVD-RW DVD+R DVD+RW discs at the same time.

AV board: includes input/output amplifying circuit of multi-channel audio/video, input/output channel selection, switch circuit, Nicam decode circuit, output terminal and tuner.

Power board: provides power required by each circuit of the player. The main output voltage has $\pm 12V$, $+3.3V$, $+2.5V$, $+5V$, $STB5V$ and $-25V$, etc. In special conditions, $STB5V$ and panel VFD drive voltage are only provided.

Main panel: includes panel function control, VFD display control, remote control and decode function, and is mainly composed by VFD and D16316.

3.1.1.1 PCB board composition figure and video signal figure

PCB board composition diagram is shown as in the following figure 3.1.1.1:

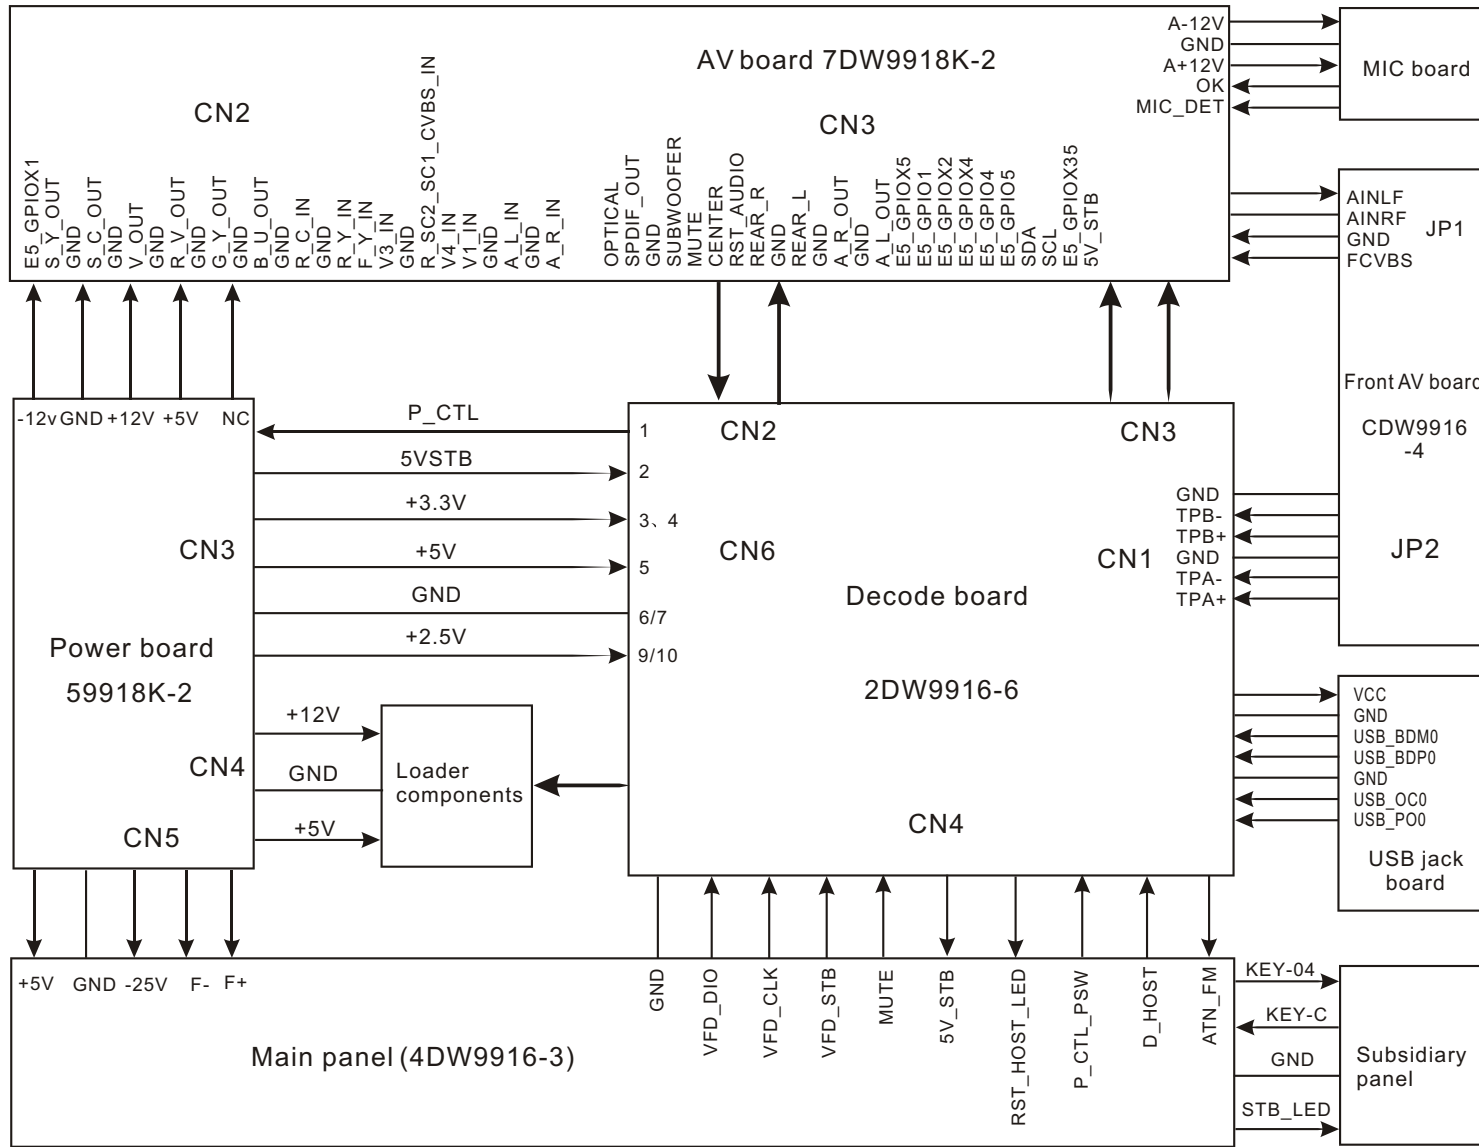

Figure 3.1.1.1 PCB board composition figure

3.1.2 Block diagram of the player

Block diagram of the player is shown in the figure 3.1.2.1:

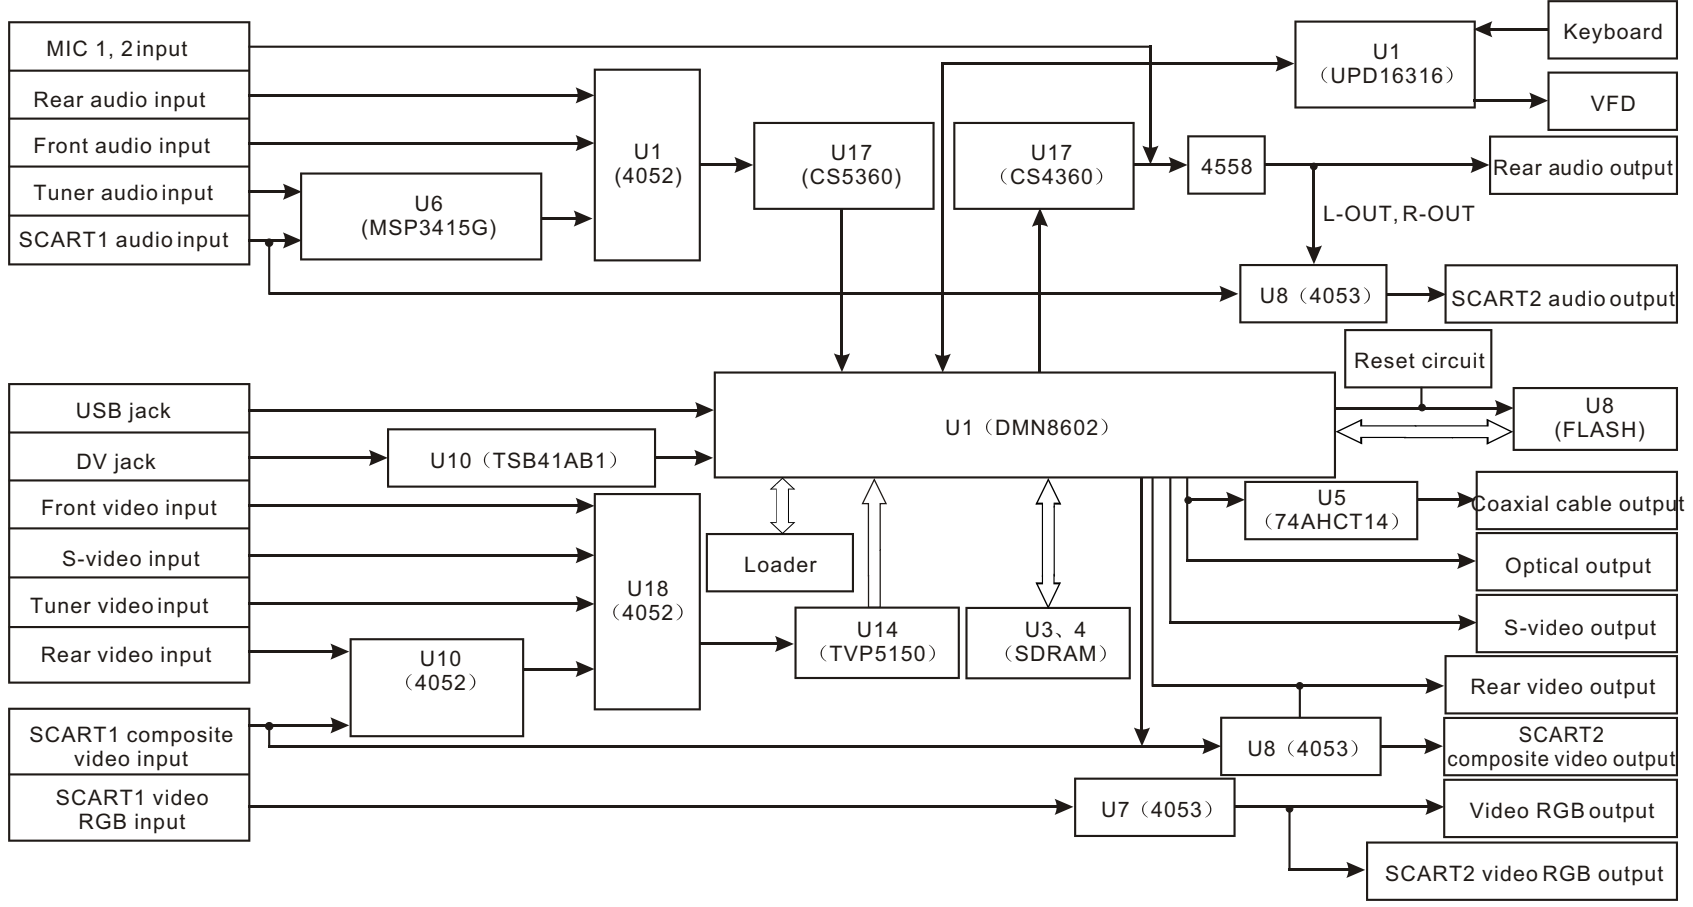

Figure 3.1.2.1 Block diagram of the player

3.1.3 Introduction to IC used by this player

Introduction to IC used by this player is shown in the following table:

Board Number	SN	Material code	Model	Location	Function explanation
Decode board 2DW9916-6	1	0881935	DMN-8602 BGA	U1	main chip
	2	0882839	EM6353BX2SP3B-2.9V SOT23-3L	U6	reset IC

Section Two Unit Circuit Principle

3.2.1 System control and code, decode circuit

1. This layer adopts the single-chip processor DMN-8602 of recordable DVD products used for single drive of the second generation of LSI Logic Company. The single chip includes a 2nd-generation DV coder, 5th-generation coder, USB controller, shown in the figure 3.2.1.1, NTSC/PAL TV coder and

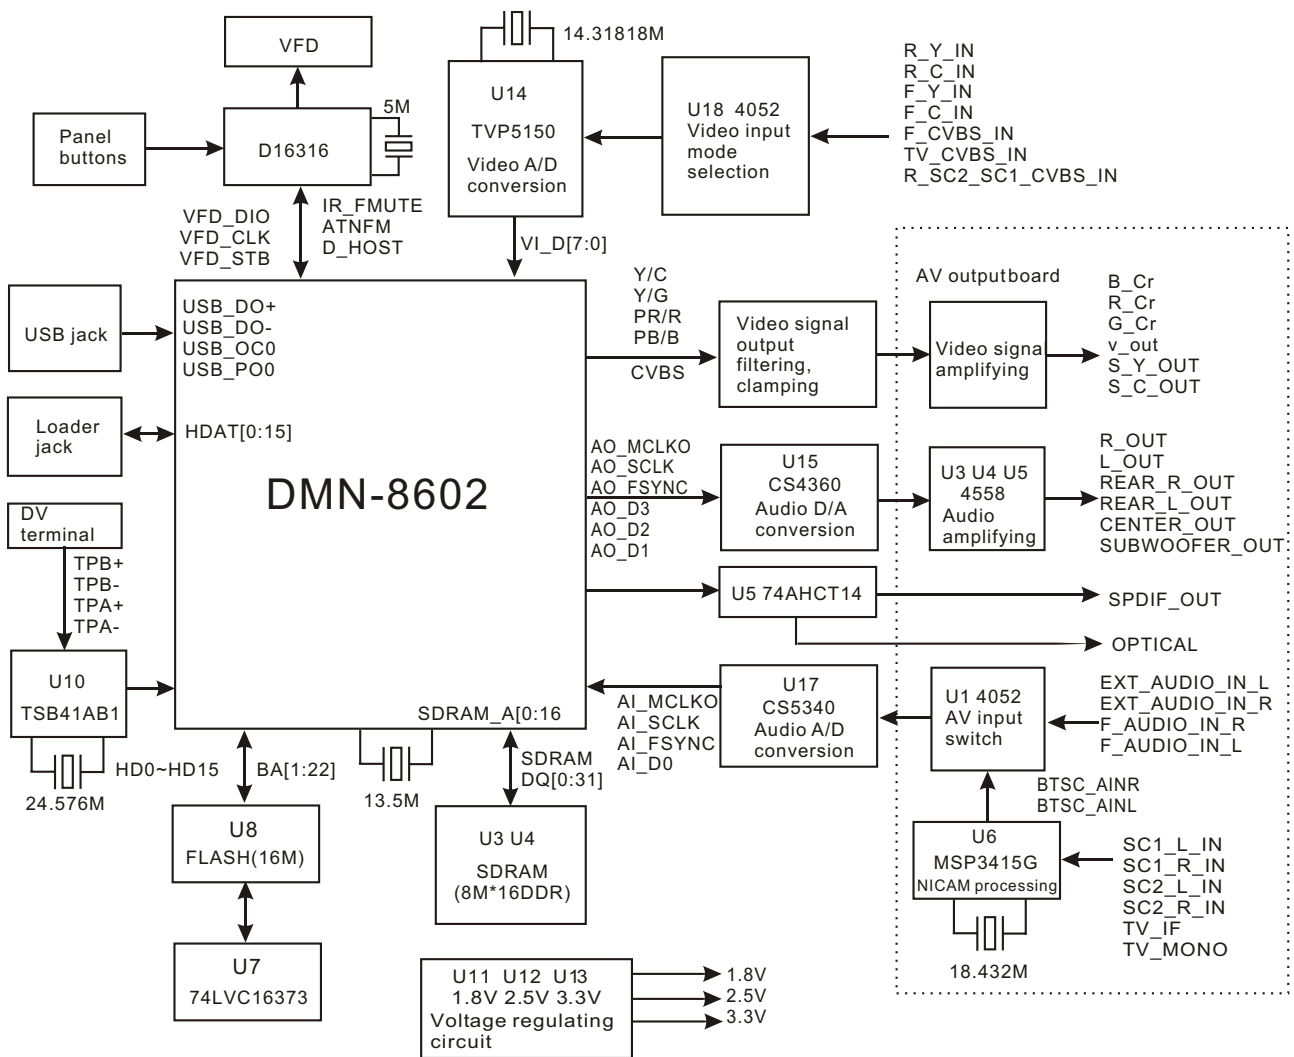

Figure 3.2.1.1 System control and code, decode circuit block diagram

DoMiNoFX Technique. Single-chip design supports all recordable DVD formats, ensures the ample features of recordable DVD; compared with the system with the similar level, the cost has been reduced greatly, and the complexity of electronic communication manufacturer is reduced at the same time. DMN-8602 provides advanced product features, for instance, the direct digital dubbing technology makes personal digital contents convert from portable video camera to DVD simplification; a single small contact control and re-playable MPEG-4 video format can make general audio, video signal adopt MPEG-2 format to record into high quality DVD discs, and also can make DV signal of some machines, such as video camera, realize DVD format with higher quality image. At the same time, this machine is also a high-performance DVD player, which may record DV signal and normal audio, video signal to MPEG-2 format in DVD+RW , DVD+R discs. Input audio/video signal, DV signal and TV TUNER signal, manual and timing record function, with playback function of DVD player, which may play DVD, VCD, SVCD, CD-DA; compatible with DVD-RW, DVD-R, DVCD, Mp3, JPEG format discs. DV (IEEE 1394) jack may realize Hi-Fi digital record, front and back multi-channel AV, S-VIDEO input and TV tuner input. Progressive scanning output and component video output makes picture more perfect. 24 bit DAC audio output high quality sound is adopted. Single-sided disc DVD+RW, DVD+R has 6-hour recordable time at most (stream 1.7 M bit/S), and 1-hour high quality image (stream 9.72 M bit/S).

2. Function realization explanation

(1) System control circuit: fulfilled by U1 DMN-8602, the basic core to fulfill the ordered working of the player, through the control to each function circuit by the bus, the player works in an orderly way according to the requirements designed by program. After switching the internal working mode through software, the system selects input signal, DV, jack, external input signal (external audio signal, external video signal and TV signal), DVD signal, USB signal. The working principle is as follows:

(2) External input: the system sends the externally-inputted video signals to decode board, through U18 4052 video input selection, sends to video decoder U14 TVP5150 for video decode, TVP5150 converts NTSC, PAL and SECAM video signal into digital component video signal, and sends the digital component video signal after being decoded to DMN-8602 for MPEG coding processing and then send to DVD recorder driver to fulfill disc record storage after coding, at the same time outputs from DMN-8602 analog video output jack directly and makes analog video signal output after being filtering, clamping and amplifying to realize the simultaneous output in the course of recording and the appearance will not be affected. The externally-inputted audio signals, after being NICAM processed on AV board through U15 MSP3415, are sent to U1 4052 for channel selection, and audio signals after selecting are sent to AD converter U17 CS5340 of decode board to converse analog signals to digital audio signals, then send to AIN jack of DMN-8602, through DMN-8602 processing, output from AOUT jack of DMN-8602, the outputted digital audio signals are sent to DA converter U15 CS4360 to convert to analog signal and then send to output terminal for output after amplifying analog signal, at the same time AO_IEC958 of DMN-8602 outputs digital audio signal.

(3) DV input means: DV signal is inputted through DV jack, then sent to U10 TSB41AB1 cable transceiver of decode board for decoding to send the data after being decoded to 1394 jack of DMN-8602 directly for code processing and then send to DVD recorder driver to realize disc record storage or output signals after being coded from DMN-8602 analog video output jack (VDENC) and AVOUT analog audio output jack, or output at the same time of recording.

(4) DVD signal output: DMN-8602 communicates with DVD|Recorder through ATAP jack, the disc information achieved by DVD Recorder is sent to DMN-8602 for decoding through ATAP jack, and the decoded data is sent to analog video output jack (VDENC) and digital audio output jack AOOUT for output.

(5) USB signal: DMN-8602 has a USB1.1 jack, which supports low speed and full speed transmission modes. USB data is sent to the USB jack of decode board DMN-8602 through jack for format conversion, and then encodes different format according to user's requirements to send to DVD recorder driver to realize disc record storage, or output from DMN-8602 analog video output jack and audio output jack directly.

The working principle of audio, video output is the same with that of DVD player. After loader reads data, it is sent to U1 DMN-8602 ATAPI jack through ATAPI bus then to decode chip DMN-8602 for audio, video decode and then save the data after being decoded inside SDRAM temporarily, when uses need to play, decode chip calls the data saved in SDRAM for replay, audio data performs D/A conversion through U15 CS4360 and outputs analog audio signal, video signals are kept inside decode chip for video decode and then output analog video signal, after filtering and amplifying, the output is completed.

3.2.2 Audio output circuit

1. Audio signal output flow chart is shown in the following figure 3.2.2.1:

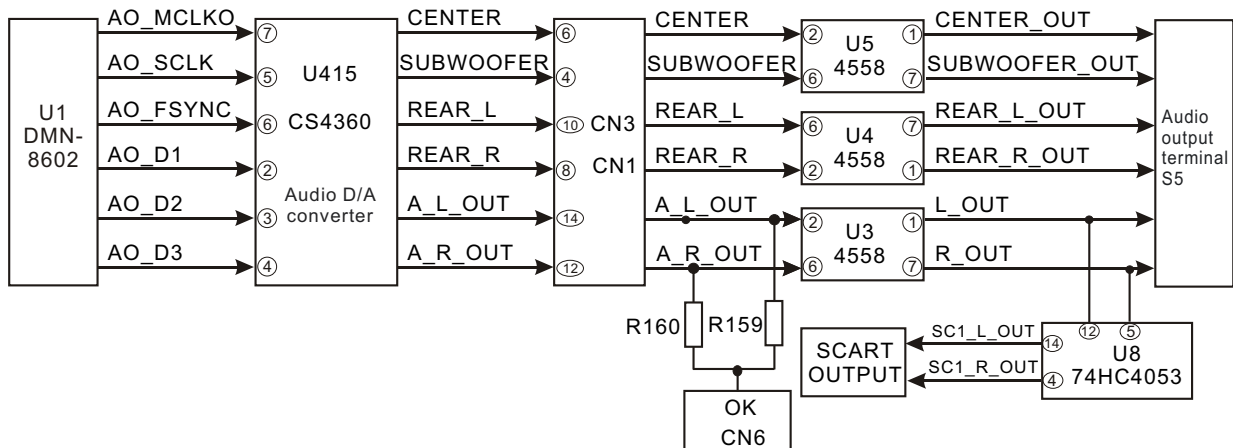

Figure 3.2.2.1 Audio signal output flow chart

When the player is playing again, decode chip U1 DMN-8602 reverts the disc information conveyed from loader, digital audio signal outputs through the pin of decode chip AOOUT module to D/A converter, audio data performs D/A conversion through CS4360 and outputs analog 5.1CH audio signal, after

Capacitor C253~C258 coupling and filtering capacitor C259~C264 filtering, audio signals are sent to CN3 to send audio signal to AV board through CN3.

Because DMN-8602 is BGA packaging, we cannot test IC pin, as for the chip about BGA packaging in future, the pin will not be noted and the output signal definition is as follows:

E5_GPIO3: the pin that decode chip performs reset to CS4630.

AO_MCLKOS: MASTERCLOCK signal.

AO_SCLK: SERIAL CLOCK signal.

AO_FSYNC: LEFT/RIGHT CLOCK signal.

AO_D1, AO_D1, AO_D2: digital audio signal serial data jack.

AO_IEC958: digital audio output (optical, coaxial).

2. Audio amplifying circuit (this part lies in AV board)

The 6-channel audio analog signals transmitted from decode board are sent to U3, U4 and U5 through CN1 for amplifying, in which, A_R_OUT A_L_OUT is sent to U3 for amplifying, MIC board, through the MIC signal conveyed from CN6, is overlayed to the input end of U3 through R159 R160, and performs mixed amplifying with left and right channel of audio signal, the signals after being amplified through filtering, R_OUT L_OUT signal is divided into two ways: one way directly outputs to audio output terminal S5, the other way performs output sound source selection through U8 (LOOP_DECODER_C end is low level, R_OUT L_OUT signal outputs) to send to SCART terminal (SC1). After amplifying and filtering through U5, SUBWOOFER, CENTER signal outputs to audio output terminal S5 for output. After amplifying and filtering through U4, REAR_R, REAR_L signal outputs audio output terminal S5 for output.

Audio amplifying circuit is mainly composed by operational amplifier, shown in the figure 3.2.2.2, take right channel signal amplifying as an instance, A_R_OUT signal arrives at reverse input end pin 6 of operational amplifier through R44, R45 for amplifying, and outputs from pin 7, in which C34, C35 are input and output filtering capacitors respectively, R43 is feedback resistor.

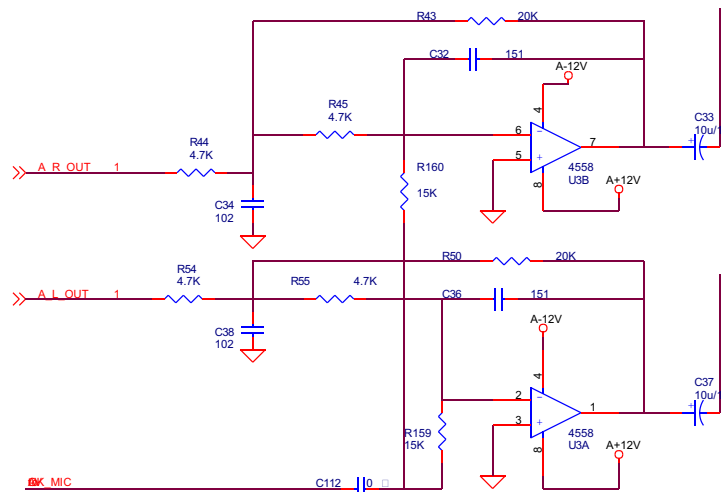

Figure 3.2.2.2 Audio amplifying circuit

3. Digital audio signal output circuit

Decode chip outputs digital audio signal (AO_IEC958) through R76 to decode board socket CN3, CN3 transmits this signal to AV board directly to input to optical terminal Op1 for output, at the same time, (AO_IEC958) also transmits through U5/R78/L5 to decode board socket CN3 and directly outputs the coaxial terminal S4 on AV board to output digital audio signal (coaxial signal).

4. Mute circuit

Mute circuit is shown in the figure 3.2.2.3:

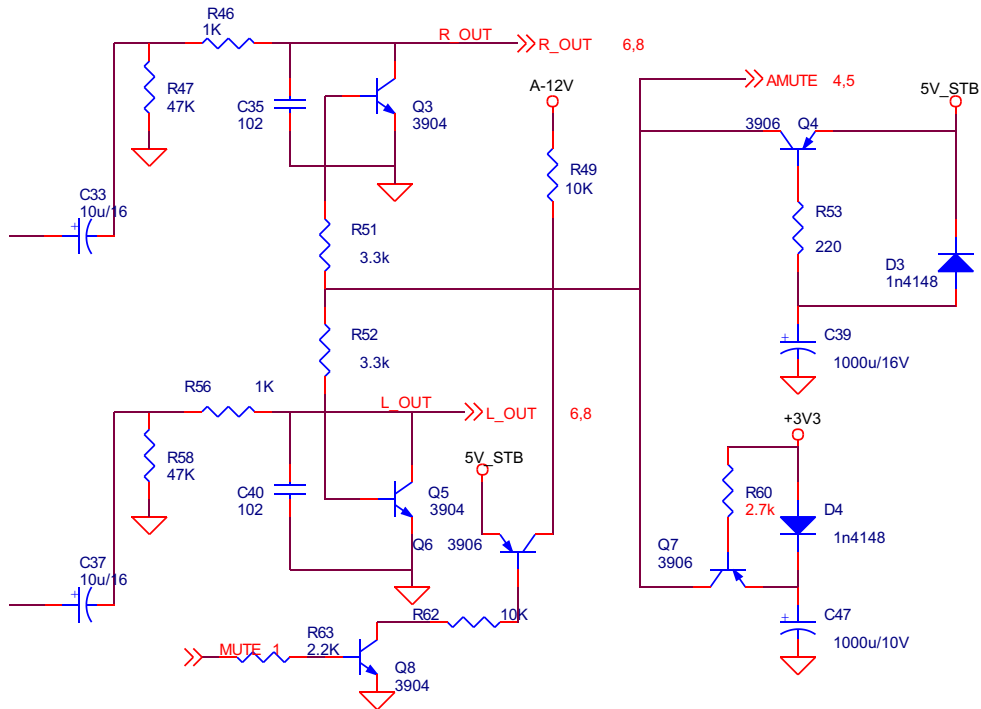

Figure 3.2.2.3 Mute circuit diagram

Power-on mute: after power on, 5V_STB output is normal, Q4 base electrode is low level, 5V_STB arrives at mute pipe through Q4C E electrode to fulfill mute function, C39 charges, when the voltage drop of the two ends is more than 4.3V, Q4 cuts off, now panel begins working and machine enters standby state, panel MUTE pin outputs high level signal and transmits to R63 of AV board through decode to make Q8 Q5 saturated on, 5V_STB transmits to the mute pipe of each channel through C E electrode of Q5 to make audio output circuit in mute state to reach the purpose of power-on mute; when machine reads disc information or switches to other working mode, MUTE changes from high level to low level, mute circuit does not work, and audio output of the player is normal.

Power-off mute: when machine enters standby state from power-on state, panel MUTE pin outputs high level signal and transmits to R63 of AV board through decode to make Q8 Q5 saturated on, 5V_STB transmits to the mute pipe of each channel through C E electrode of Q5 to make audio output circuit in mute state to reach the purpose of mute. After power off, C47 discharges through Q7 to make mute pipe of each channel saturated on to realize the function of power-off mute.

3.2.3 Video output circuit

1. Video signal output flow chart is shown in the figure 3.2.3.1:

Figure 3.2.3.1 Video signal output flow chart

2. Filtering and amplifying circuit

When the machine is playing again, decode chip U1 DMN-8602 reverts the disc information conveyed from loader into digital video signal, through D/A converter inside U1 DMN-8602, reverts digital video signal to analog video signal to output, analog signals are divided into 6 channels: chroma signal (C), brightness signal (Y), composite video signal (CVBS) and RGB signal. Shown in the figure 3.2.3.2, composite video signals, through video filtering circuit and amplifying circuit, perform filtering and amplifying to video signals and then output to AV board.

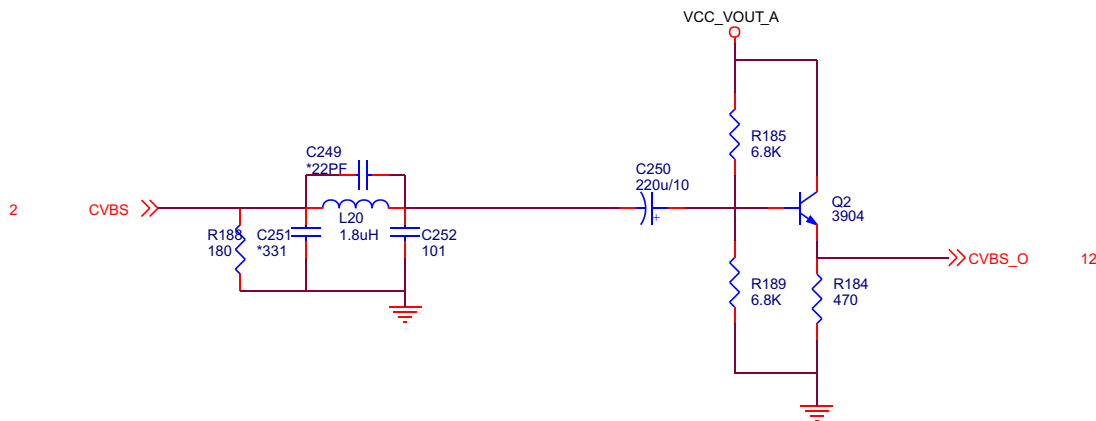

Figure 3.2.3.2 Filtering and amplifying circuit

3. Video output circuit

5-channel video signals, after being filtered through filtering circuit, directly output to AV board for amplifying output. Video signal is sent to socket CN2 of AV board through Cn5, in which S_C_OUT S_Y_OUT signal, after being amplified by the amplifying circuit composed of Q1 Q2, directly transmits to S-video (S3) to output. One way of V_OUT signal is sent to composite video terminal S3 through R29 to output directly, the other way performs output selection (when LOOP_DECODER_C end is low level, V_

Signal outputs) through U8 to output to SCART terminal (SC1). The 3-way component video signals of R_V_OUT, G_Y_OUT and B_U_OUT are sent to U7 for output selection (when LOOP_DECODER_C end is low level, R_V_OUT G_Y_OUT B_U_OUT signal outputs, when LOOP_DECODER_C end is high level, the component video signal inputted by the other SCART (input terminal) outputs). R_V G_Y B_ signals outputted through selection, after being amplified by the amplified circuit composed by Q13 Q14 Q15, output to component video terminal (S4) and SCART output terminal.

3.2.4 Audio input circuit

The audio signals inputted by AV input terminal and tuner, through input switch circuit selection, audio signals performs A/D conversion through U17 Cs5340 and outputs serial audio data stream which transmits to U1 DMN-8602 digital audio input port, DMN-8602 performs coding to externally-inputted audio signal to transmit the signal after being coded to loader and controls loader and feed circuit through DMN-8602 to fulfill the record working of disc.

1. Audio input flow chart is shown in the figure 3.2.4.1:

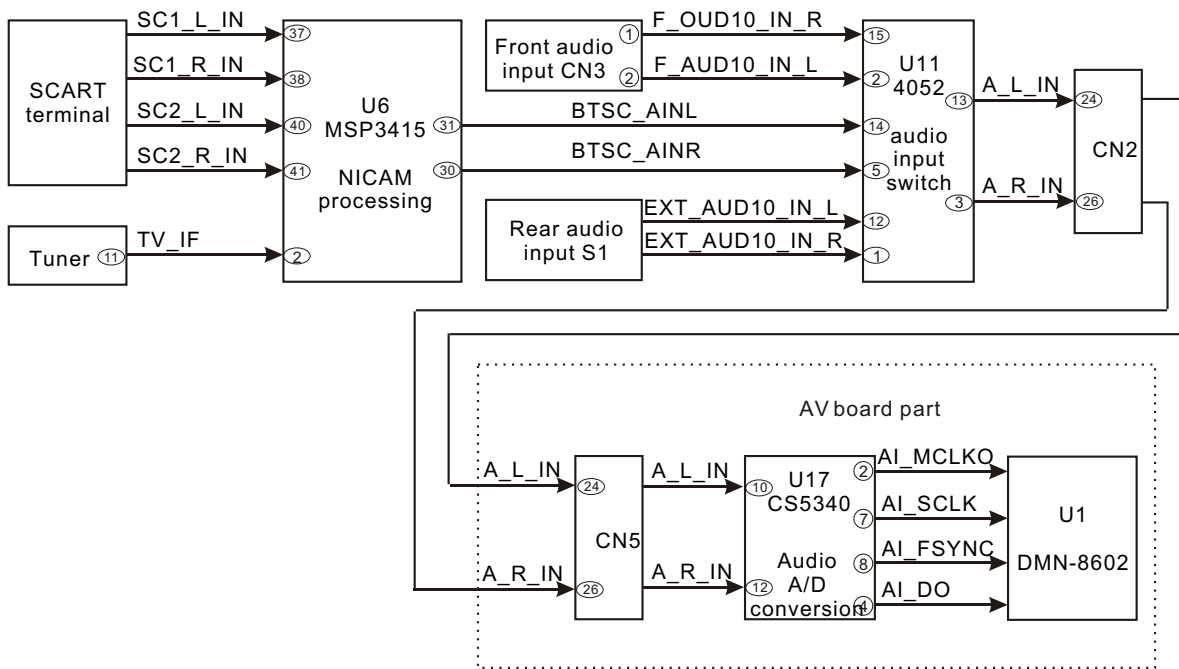

Figure 3.2.4.1 Audio input flow chart

2. Audio input working principle: take TV signal as an instance, other signals are the same on the whole. When the machine is set in TV signal input, TUN1 receives high frequency signal and then outputs audio signal after being processed. Tuner pin function introduction is shown in the following table:

PIN	Name	Function description	working voltage (v)	PIN	Name	Function description	working voltage (v)
1	Vcc1	power supply pin 1	5	8、9	NC	blank pin	0
2	BT	channel selection pin (unused)	9.4	10	AGC	AGC control pin (unused)	4.36/1.91
3	VCC2	power supply pin 2	5	11	2ND SIF	audio signal output	0
4	SCL	clock signal pin of IIC bus	3.63	12	VIDEO OUT	video output	2.14/1.38
5	SDA	data signal pin of IICbus	3.63	13	VCC3	power supply pin 3	5
6	AS	unused (grounding)	0	14	AUDIO OUT	MONO audio signal output	2.44
7	AFC	AFC control pin (unused)	1.42/0.9				

3. NICAM processing circuit

Audio signals output from pin 11 of TUN1, and also may output mono channel audio signal from pin 14. Now we do not use pin 14 to output mono channel audio signals. Audio signal TV_IF, after being coupled by C80 C81, arrives at NICAM decode IC U6 (MSP3415) for NICAM decode, at the same time, the audio input of SCART1 SCART2 also inputs to U6 for audio switch, and the audio signals after being switched are outputted by pin 30/31 of U6. The switch of this output sound source is decided by software; when the machine is set in TV signal input, BTSC_AINL and BTSC_AINR output the audio signal of TV set; the TV audio signals after being NICAM decoded output to U1 for selection through pin 30, 31 of U6.

4. Audio input switch circuit

Shown in the figure 3.2.4.2, U1 has 4 kinds of sound source input: front audio input (F_AUDIO), back audio input (R_AUDIO), audio signal (BTSC_AINR BTSC_AINL) inputted by NICAM decode IC and sound source or FM sound source used by LOOP function. Audio signals input from pin 1, 2, 4, 5, 12, 14, 15, 11 of U1, and then output from pin 3, 13 to audio A/D conversion circuit after switch. The sound source selection truth value table is shown as follows:

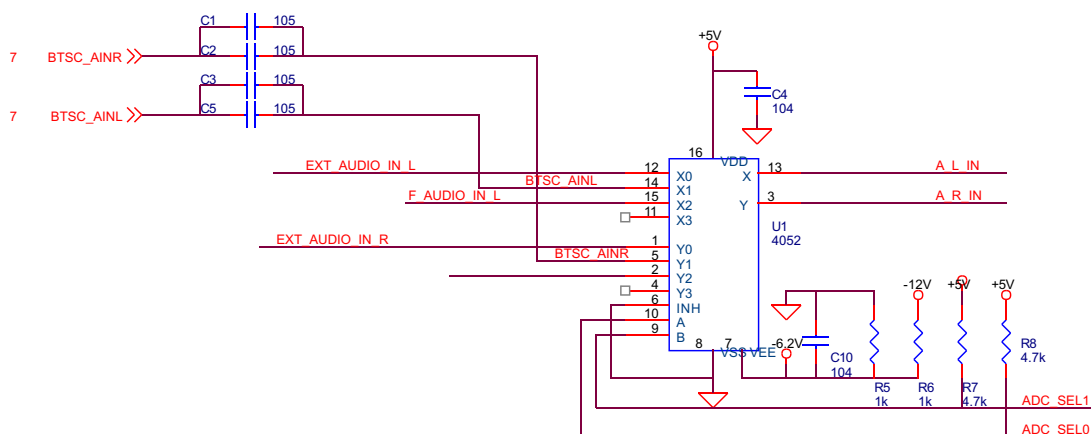

Figure 3.2.4.2 Audio input switch circuit diagram

Sound source selection truth value table:

B	A	ADC_SEL1	ADC_SEL0	SOURCE
1	1	1	1	R AUDIO
1	0	1	0	TUNER&SCART
0	1	0	1	F AUDIO
0	0	0	0	FM OR LOOP

5. Audio A/D conversion circuit

Shown in the figure 3.2.4.3, the audio signals after being selected (A_L_IN A_R_IN) are outputted from pin 13, 3 of U1 to CN2 and then transmitted to decode board Cn5. The inputted audio signals directly input to audio A/D converter CS5340 (U17) for A/D conversion.

Analog audio signals input from pin 16, 12, the digital audio signals AI_D0 after A/D conversion directly input to DMN8602 for coding and recording, and DMN8602 outputs this audio signal at the same time. Audio output circuit (output together with the played audio signal) outputs audio signal, which facilitates use to select something to record.

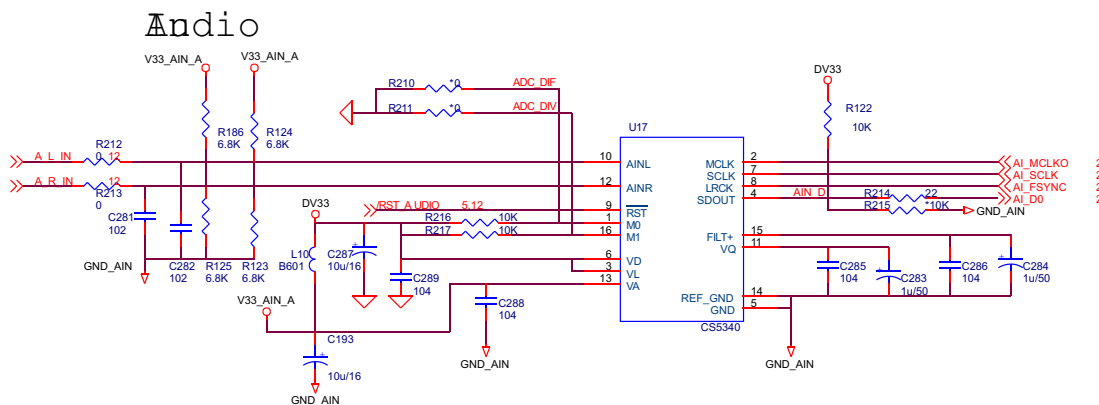

Figure 3.2.4.3 Audio A/D conversion circuit diagram

3.2.5 Video input circuit

The video signals inputted by AV input terminal, S-Video terminal and tuner, through being selected by input switch circuit, video signals select through U14 U1 TVP5150 and perform A/D conversion, the video data stream is outputted to U1 DMN-8602 digital video input port. DMN-8602 performs code to externally-inputted video signal and transmits the signal after being coded to loader, DMN-8602 controls loader and circuit to complete the record working of disc.

1. Video input flow chart is shown in the figure 3.2.5.1:

Figure 3.2.5.1 Video input flow chart

As for video signal input, take tuner input as an instance, when the machine is switching to TV signal input, tuner is controlled by IIC bus to perform audio channel selection or other function operation through firmware. Video signals output from pin 12, through the amplified circuit composed of Q31/Q33, and amplify the video signals of TV set to input to decode board for selection. The definition of each video input signal on CN2 of Av board has TV_V1_IN (video signal transmitted from tuner), V3_IN (front composite video signal), R_Y_IN R_C_IN is chroma and brightness signal inputted by rear S-video, V2_IN is rear composite video signal input, this channel signal selects with SCART terminal and inputs to decode board through R_SC1_SC2_CVBS_IN pin (for the switch relationship with SCART, we will introduce in SCART terminal switch).

2. Video input switch circuit

Shown in the figure 3.2.5.2, video input signals have: front video, rear video (includes SCART terminal input), TV signal input and rear SD-video (front terminal is not used in this player). This switch

Circuit is controlled by E5_GPIO32 E5_GPIO33 of U1 DMN8602 to realize different input selection, and the truth value table is shown as follows:

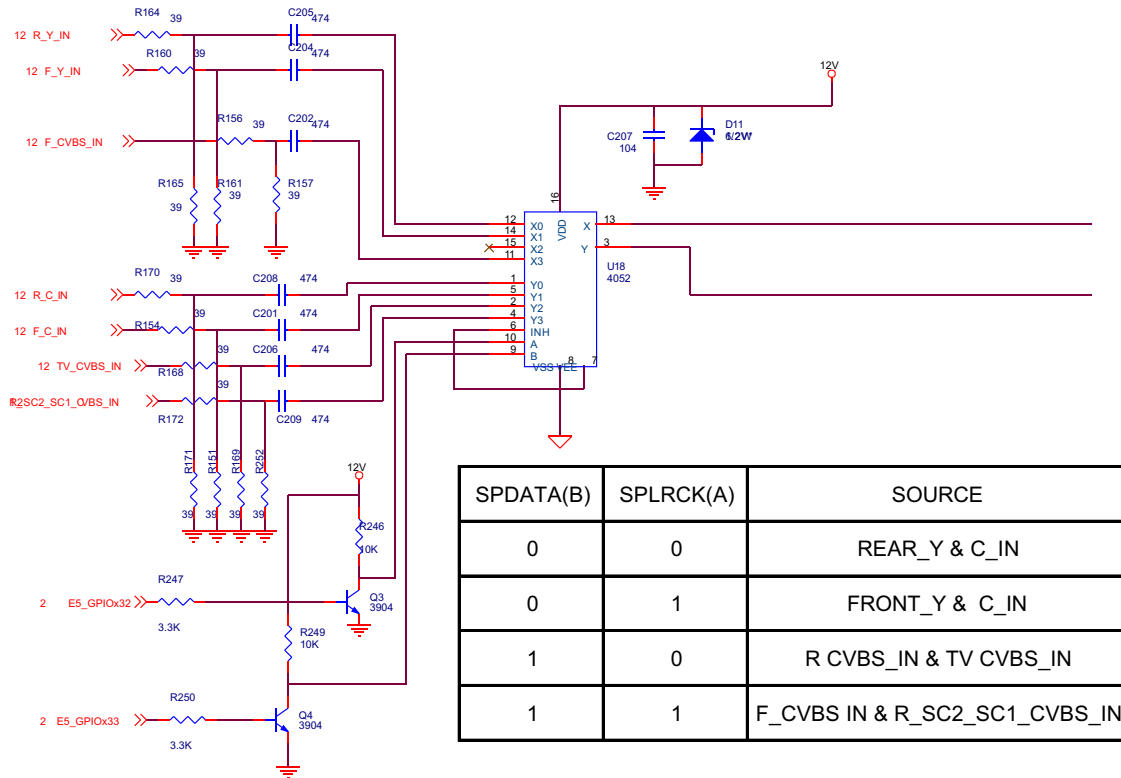

Figure 3.2.5.2 Video input switch circuit diagram

3. Video A/D conversion circuit

Shown in the figure 3.2.5.3, video signals, after being selected by U18, directly input to pin 1, 2 of video coder U14 (TVP5150), under the control of system, U14 switches analog video signals to digital video signals, and adopts 8-bit parallel data means to input to UI DMN8602 for coding and recoding.

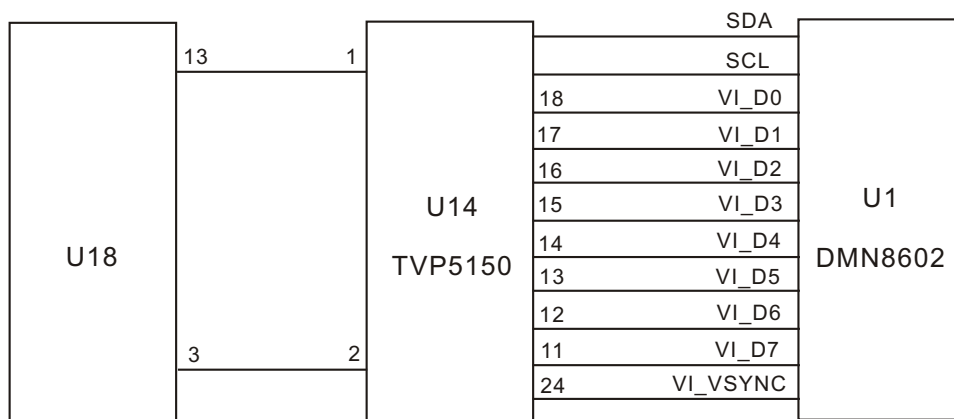

Figure 3.2.5.3 Video A/D conversion circuit diagram

3.2.6 Reset circuit

1. Reset circuit block diagram is shown in the figure 3.2.6.1:

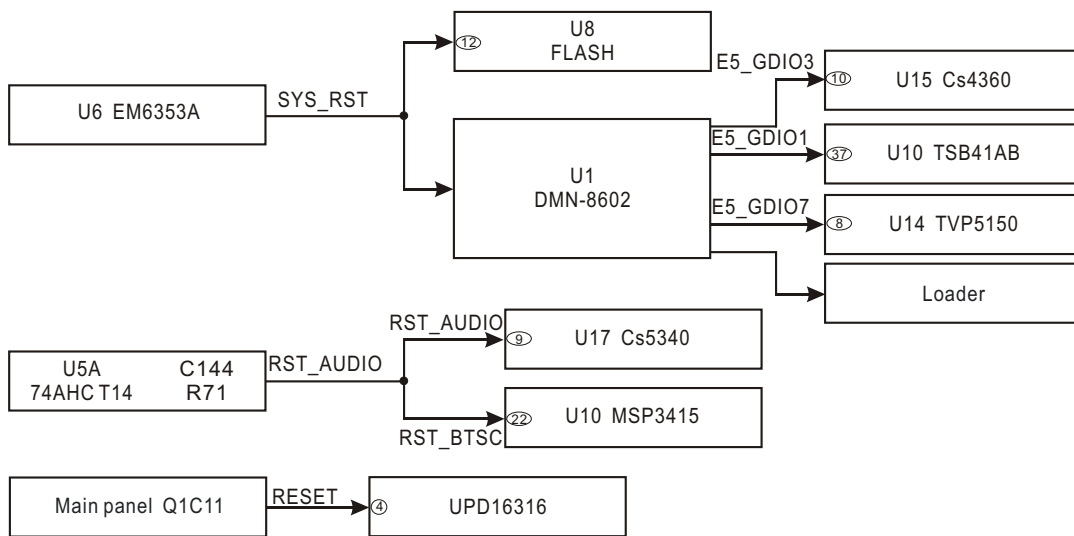

Figure 3.2.6.1 Reset circuit block diagram

2. System reset circuit

Shown in the figure 3.2.6.2, when machine enters working mode from standby, V33 voltage increases, pin 1 of U6 outputs a level signal that maintains 25MS to reset system and FLASH; after system reset finishes, U1 outputs multi-channel reset signal to other subsidiary circuit for reset (loader, CS4360, TSB41AB, TVP5150).

Figure 3.2.6.2 System reset circuit diagram

3. Audio reset circuit

Shown in the figure 3.2.6.3, after machine enters working mode from standby, the voltage on two ends of C144 cannot change suddenly, pin 1 of U5 inputs high level during the course when C144 is charging, so pin 2 of U5 outputs low level; after C144 is fully charged, voltage of pin 1 of U5 changes to low level, and pin 2 of U5 keeps outputting high level. The reset time of this circuit is decided by C144 and RC of R71.

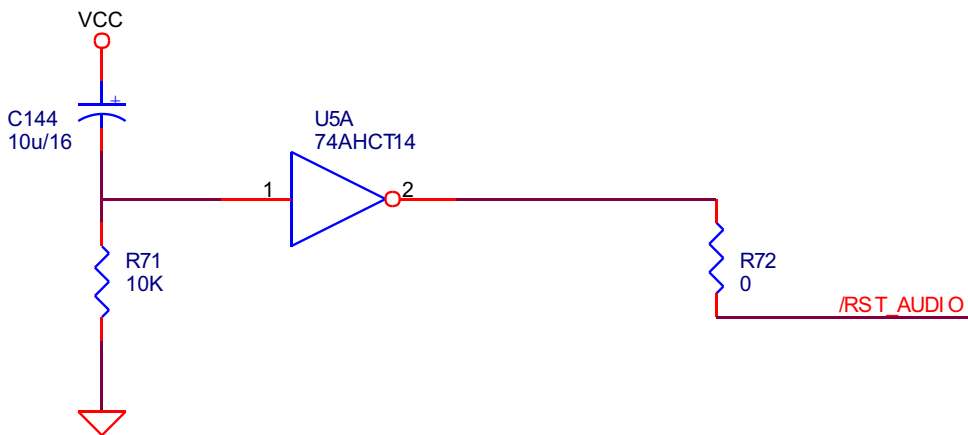

Figure 3.2.6.3 Audio reset circuit diagram

3.2.7 IIC bus control circuit

IIC bus is a kind of simple, dual-direction and synchronous serial bus developed by PHILIPS company, only two lines (serial clock line and serial data line) are required to transmit information among the elements that connect bus. This bus is high-performance serial bus, with the judge and high/low speed device synchronous function required by multi-system and application is very wide. SDA SCL bus control connecting diagram is shown in the figure 3.2.7.1:

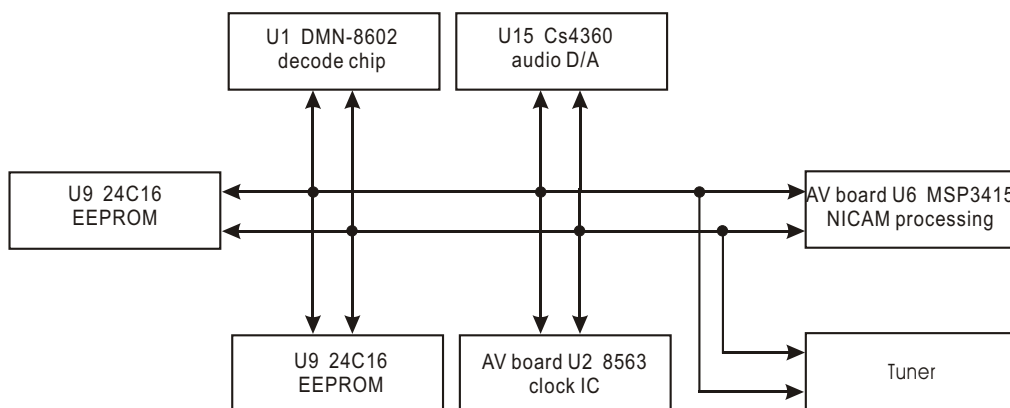

Figure 3.2.7.1 SDA/SCL connecting diagram

2. Data transmission regulation of IIC bus

Once data transmission of IIC bus from main player is called a frame, which is composed of start initiating signal, address code, some data byte, response bit and stop signal. When communication starts up, it sends out an initiating signal (when SCL line is high level, SDA line produces a descend edge), address code of subordinate machine (8-digit) and read-write signal; when communication stops, main machine sends out a stop signal (when SCL line is high level, SDA line produces a ascend edge). During the course of data transmission, when SCL line is high level, data of SDA line must be assured stable; transmission of one byte's data, receiver must send out a response signal. Transmission speed of bus is 100kbps (standard)~400kbps (high speed). When adopting +5V power to supply power, input level is ruled as: $V_{ILmax}=1.5V$, $V_{IHmin}=3V$; when adopting wide power voltage, level is ruled as $V_{ILmax}=1.5V_{DD}$, $V_{IHmin}=3V_{DD}$.

3. This player adopts the IIC bus defined by DMN8602 to control each function circuit. For the sake of understanding, we suppose DMN8602 is the main unit, other chips are subordinate unit, the main unit sends control information and receives the status report information sent back by subordinate unit, and sends new information according to report information to the function circuit that needs control. The subordinate unit may perform the control information sent from main unit and report the status information of this unit to main unit to realize the control function of I2C bus through the dual-direction information exchange course. In which, 24C16 is status memorizer used to store the user-set information required to save to facilitate the usage next time when power on, the main functions of this player may be controlled by IIC bus (such as, video A/D conversion, audio D/A conversion, tuner channel selection, clock, user information, and NICAM decode).

3.2.8 Voltage regulating circuit

1. 1.8V voltage regulating circuit, shown in the figure 3.2.8.1, is mainly provided for the usage of the logic circuit inside decode chip, 2.5V power inputs from pin 1 of U11, after being voltage regulated by

Figure 3.2.8.1 1.8V voltage regulating circuit

Voltage regulating IC Po018, outputted by pin 3, the output voltage of this voltage regulating circuit may be adjusted through R145 R146.

2. 3.3V voltage regulating circuit, shown in the figure 3.2.8.2, mainly supplies power for decode chip, FLASH and SDRAM. 5V power inputs from pin 3 of U12, through being voltage regulated by voltage regulating IC Lt1117, is outputted by pin 2, output voltage of this voltage regulating circuit can be adjusted through R147.

Figure 3.2.8.2 3.3V voltage regulating circuit diagram

3. 2.5V voltage regulating circuit, shown in the figure 3.2.8.3, mainly supplies power for decode chip, 3.3V power inputs from pin 1 of U13, through being voltage regulated by voltage regulating IC Pq025, is outputted by pin 3, output voltage of this voltage regulating circuit can be adjusted through R149 R150.

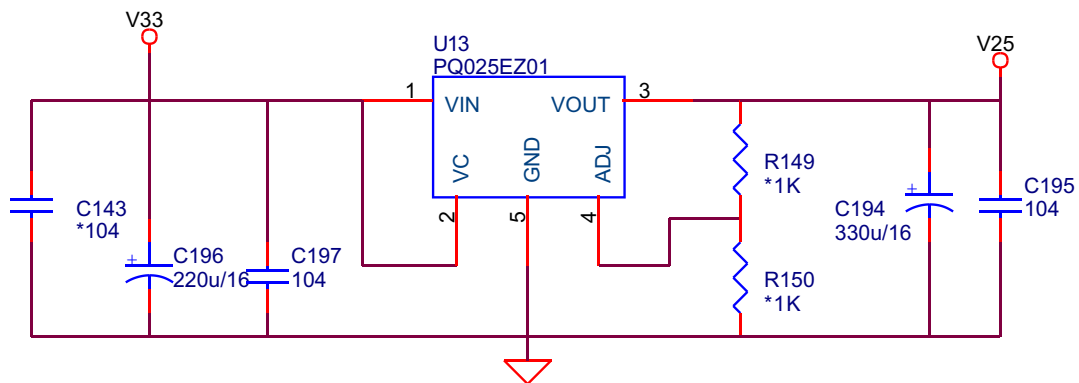

Figure 3.2.8.3 2.5V voltage regulating circuit diagram

3.2.9 USB jack circuit

1. DMN-8602 integrates USB module circuit inside, shown in the figure 3.2.9.1, and it can directly read external USB device. After the integrated USB module circuit inside DMN-8602 detects external equipment connection, it applies for intermission continuously to the control module of DMN-8602 to wait for the response of DMN-8602 control module; after control module gives response, USB module circuit achieves internal bus to read data of external equipment in directly.

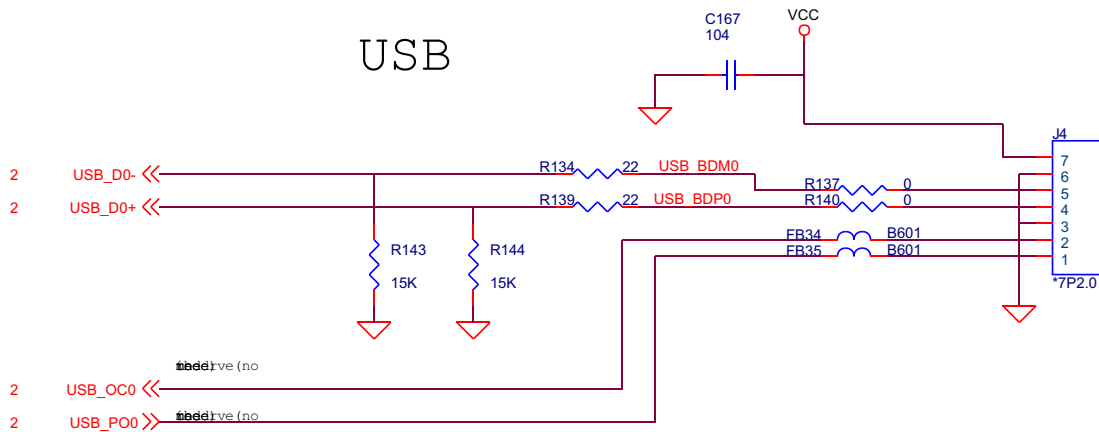

Figure 3.2.9.1 USB circuit diagram

2. Introduction to pin of USB is shown in the following table:

Pin	Signal	Pin	Signal	Pin	Signal	Pin	Signal
1	+5V	1	+5V	3	Data+	3	Data-
2	Data-	2	Data+	4	Grounding	4	Grounding

3.2.10 DV jack circuit

In DV player and DVCAM player, you will see a flat 4P or 6P port, which is usually called DV digital jack and named as i.LINK by SONY company. It accords with IEEE 1394 standard and has the following features:

Directly transmit digital data, so there is no picture and audio distortion.

Only one cable is needed to make video, audio and control signals perform data multi-channel transmission.

Hot plugging and unplugging function may perform data transmission among multiple data

TSB41AB1: it has DV monitoring circuit inside, which can automatically detect DV input. System selects DV mode, DMN-8602 communicates with TSB41AB1, when DV jack has signal input, signals inputted by DV input to pin 28-31 of TSB41AB1, after being processed by TSB41AB1, then they are sent to DMN-8602 for coding and decoding.

3.2.11 Loader jack circuit

A complete “loader components” is used in this machine, which includes servo circuit, laser head and mechanical part. Working principle is the same with that of other players, so we will not repeat here. The following is loader pin introduction shown in the following table:

Pn	Name	Description	Pn	Name	Description
1	/RESET	Reset (reset signal)	21	n/c	Not connected (blank)
2	GND	Ground (ground)	22	GND	Ground (ground)
3	DD7	Data 7	23	/IOW	Write Strobe (w rite gating)
4	DD8	Data 8	24	GND	Ground (ground)
5	DD6	Data 6	25	/IOR	Read Strobe (read gating)
6	DD9	Data 9	26	GND	Ground (ground)
7	DD5	Data 5	27	IO_CH_RDY	I/O ready

3.2.12 Control panel

1. Control panel block diagram is shown in the figure 3.2.12.1:

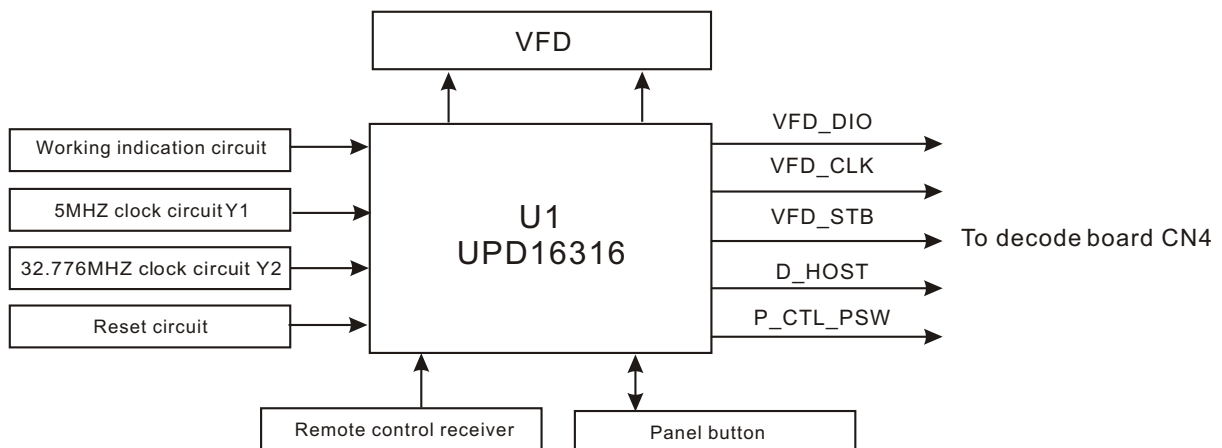

Figure 3.2.12.1 Control panel circuit block diagram

2. Reset circuit

Shown in the figure 3.2.12.2, it is a low level effective reset circuit, after power on, VDD power charges C11 through R24, the voltage on two ends of capacitor cannot change suddenly, so Q1 base electrode is high level, Q1 is saturated on, RESET end outputs low level; the charge course of capacitor makes the electric potential of Q1 base electrode decreases quickly, Q1 cuts off, RESET end outputs high level and reset finishes.

Figure 3..2.12.2 Reset circuit

3. Remote control circuit

The power supply of remote control circuit uses 5V_STB power to ensure the remote control receiver can receive the instruction transmitted from remote controller in standby status. The remote control instruction received by remote control receiver directly transmits to panel IC for remote control decode.

In standby status, panel IC only receives the wake code transmitted from remote controller.

4. Standby working status

After power on, P_CTL_PSW control end is low level, Q2 is saturated on to make the standby light of subsidiary board on and perform standby instruction, now power board main power +12V, +5V, +3.3V have no voltage output, 5V_STB and other supplementary winding power outputs normally to provide reset circuit to reset U1 (pin 4 of U1) at the same time of power on, panel IC standby module enters working status, in which Y2 and the clock circuit inside IC produce clock signal to realize the time display and timing function in standby status, Y1 is externally connected clock of D16316. In standby status, panel control IC and display screen have working power, so the display screen of machine can normally display the time in standby status.

5. Working status after power on

When users are pressing POWER button on the panel or remote controller, UPD16312 enters normal working status, P_CTL_PSW ens inputs high level, panel standby indicator light turns out, the

Blue light of panel receives power and is on, main power output of power board is normal, each circuit of the player begins working, machine displays power-on picture and enters working status. After power on, audio circuit will produce noise in the course of power on, to avoid noise being amplified outputted, panel IC (46PIN) outputs MUTE signal to mute circuit (working principle will be introduced in mute circuit), after decode system works, it communicates with panel IC to fulfill functions of panel display and remote control function operation.

3.2.13 AV circuit

AV circuit is mainly in charge of audio/video signal input and output, audio/video amplifying circuit, audio input switch circuit, NICAM processing circuit, clock circuit, SCART terminal input and output control circuit.

1. AV circuit block diagram is shown in the figure 3.2.13.1:

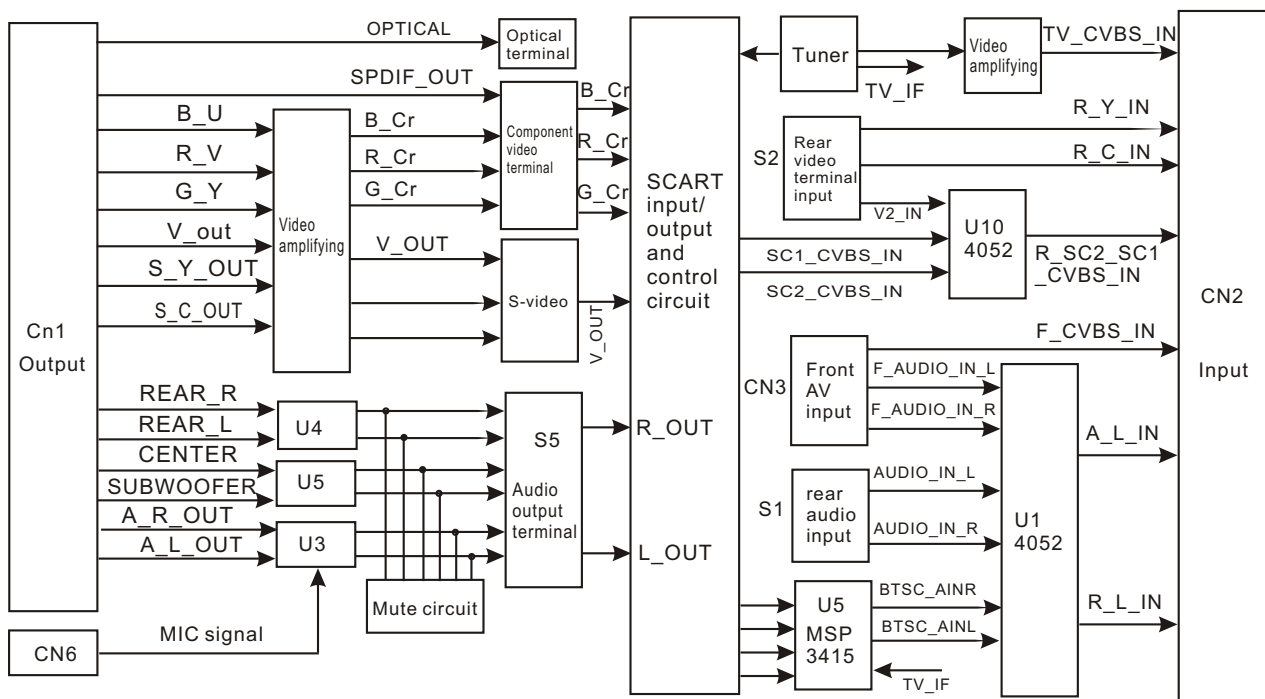

Figure 3.2.13.1 AV circuit block diagram

2. Clock circuit: shown in the figure 3.2.13.2, clock circuit mainly provides a clock signal for system, which can record year, month and date. Power supply means of External battery or standby power is adopted, U2 is clock IC with working voltage between 2.0 and 5.5V, after machine power off, battery Bt1 supplies power for U2 through D2, after the player power on or enters standby status, 5V_STB supplies power for U2 through D1. D1 D2 makes a separation function in the circuit.

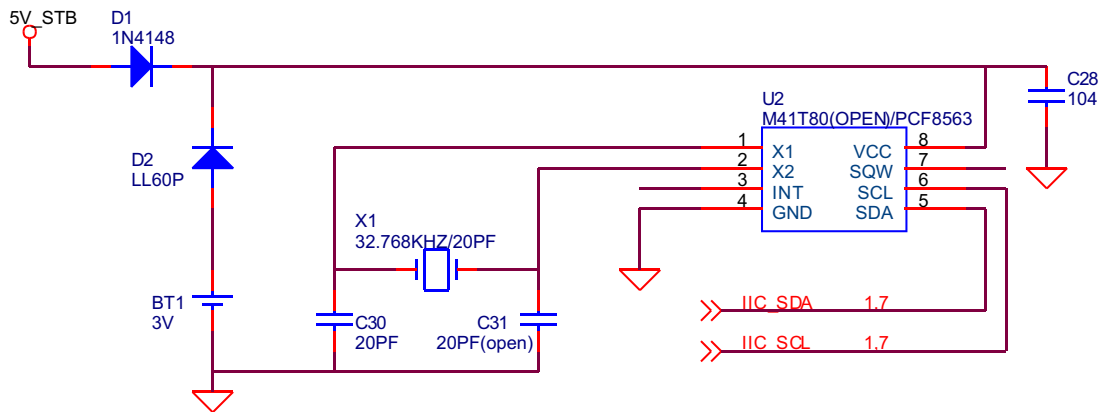

Figure 3.2.13.2 Clock circuit diagram

3. SCART output mode control circuit

(1) CVBS/RGB output control circuit: when the machine is in power-on status, SCART terminal is required to output RGB signal, we switch the output mode if machine in RGB state, shown in the figure 3.2.13.3, decode chip E5_GPIOX4 outputs high level to make Q28, Q26 saturated on, SC1_CVBS_RGB_SEL end outputs high level; when output mode of the machine is composite video, decode chip E5_GPIOX4 outputs low level to make Q28, Q26 cutoff, SC1_CVBS_RGB_SEL end outputs low level; when machine enters standby status (machine enters LOOP working mode), +5V power is 0V, Q29 cuts off, Q27 is controlled by VI_FSS end level of SCART input terminal, so SC1_CVBS_RGB_SEL end is controlled by VI_FSS end, now output mode is decided by external input source.

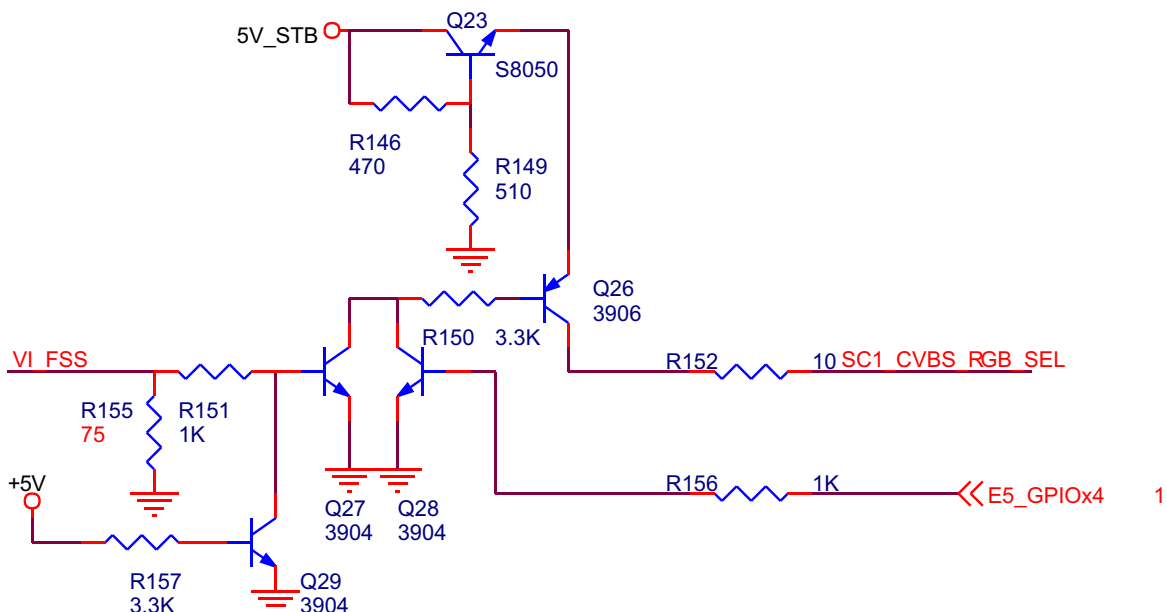

Figure 3.2.13.3 CVBS/RGB output control circuit diagram

(2) Screen display ratio control circuit

When the machine is playing discs with different ratio pictures, if SCART terminal output is needed, we set “screen ratio setup” item in machine setup page according to requirements, shown in the figure 3.2.13.4, E5_GPIOX2 end of decode chip outputs level to make Q17, Q20 on, AV_CONTROL end outputs the voltage required by screen ratio switch to TV set. When machine enters standby status (machine enters LOOP working mode), AV_CONTROL ens is controlled by pin 8 of SCART input terminal.

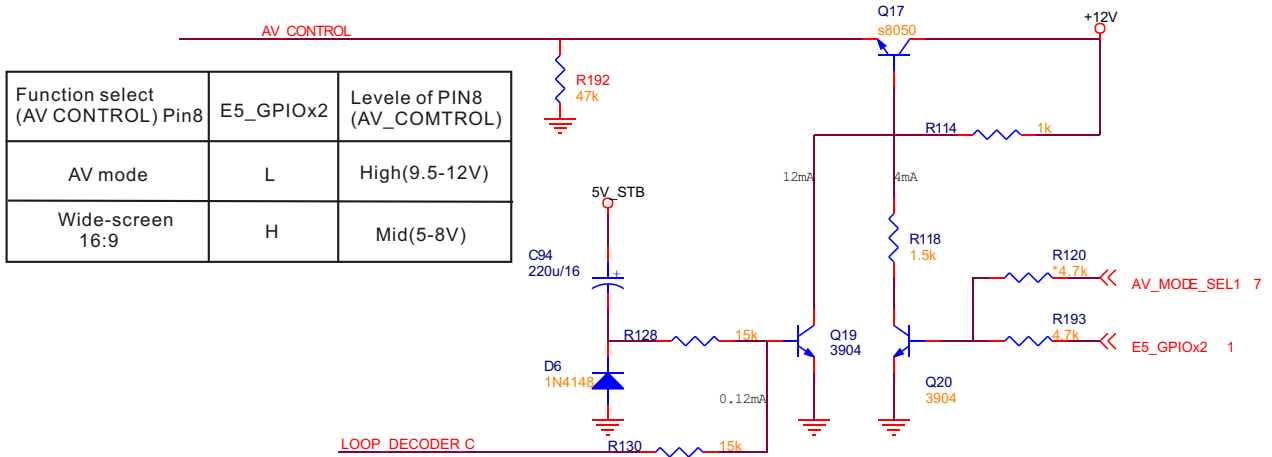

Figure 3.2.13.4 Screen display ratio control circuit

4. SCART circuit block diagram is shown in the figure 3.2.13.5:

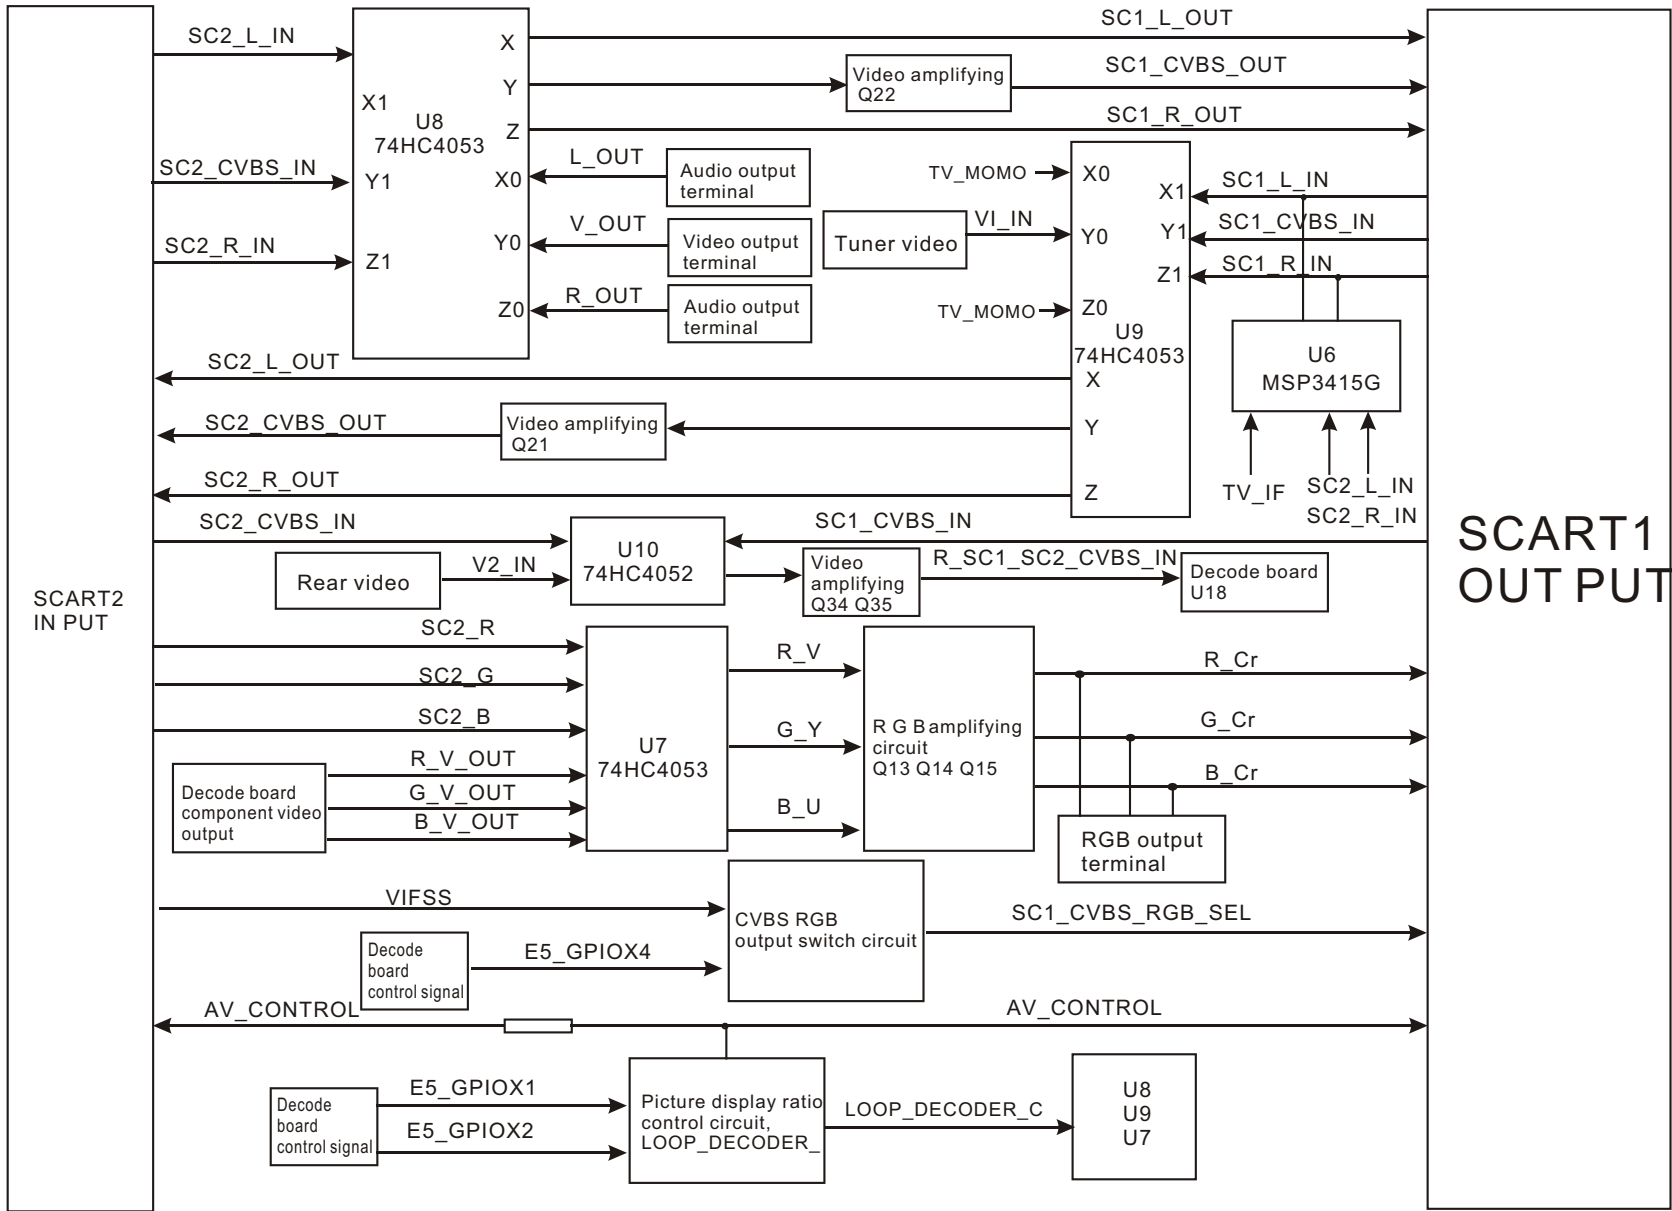

Figure 3.2.13.5 SCART circuit block diagram

(1) Audio, video signals output flow chart and working principle

When the player is in DVD playback status or external input status, LOOP_DECODER_C end is low level, CVBS/RGB switch circuit and screen display ratio control circuit are both controlled by the control signals outputted by decode. Audio/video signals input to U8 and output from pin 14, 15, 4 of U8, audio signals are directly sent to SCART output terminal for output, video signals are amplified through the amplified circuit composed of Q22 and then sent to SCART output terminal for output. There is one group of input port in output terminals. Suppose output terminal is connected with TV set, audio/video signals sent from TV set input from input port to NICAM decode IC for selection, and input to main board for record usage. Video signals select through U10, Q34/Q35 amplifies and inputs to main board for record usage. Audio/video signals sent from tuner output through U9 to the output port of SCART input terminal to connect decoder or other re record devices. Component video switches through U7 and we have introduced in video output part.

Remark: this player does not use DECODER function; to be easy to understand, we define SCART (SC2) is input terminal, and SCART (SC1) is output terminal.

(2) LOOP working mode signal flow chart and working principle

When the player is in standby status, the machine enters LOOP working mode (only when SCART input and output are inserted at the same time, there is LOOP working mode function), LOOP_DECODER_C end is high level; pin 14, 15 of U8 output the audio/video signals inputted by SCART input terminal to make signals of input terminal connect to SCART output terminal through U8 for output. There is one group of input port in output terminal. When output ens is connected with TV set, audio/video signals sent from TV set input from the input port, after selection through U9, output to the output port of "SCART input terminal" for output. The component video signals inputted by SCART input terminal output to the amplified circuit composed of Q13 Q14 Q15 through U7 for output. When LOOP is working, CVBS/RGB output control circuit and screen display ratio control circuit do not work and are totally controlled by input source.

Remark: LOOP function is a switch function, in this period, the machine has no contact with external signal, but is only used as a switch port. To be easy to understand, we define Sc1 as output terminal, and Sc2 as input terminal (different from principle diagram, only for reference).

5、 SCART terminal function selection is shown as the following table:

PIN	Definition	Description	Signal direction	PIN	Definition	Description	Signal direction
1	SC1_R_OUT	right channel audio output	OUT	12	NC	unused	
2	SC1_R_IN	right channel audio input	IN	13	GND	R_Cr signal ground

10	NC	unused		21	GND	ground wire	
11	SC2_G	G signal input	IN				

3.2.14 MIC circuit

1. MIC circuit block diagram is shown in the figure 3.2.14.1:

Figure 3.2.14.1 MIC circuit block diagram

2. MIC mute circuit

Shown in the figure 3.2.14.2, microphone detect is fulfilled through judging the level change of microphone socket MIC_DET pin; when microphone is inserted, MIC_DET +12V voltage suddenly decreases to 0V, C13 C14 in the circuit discharge through Q3 to make Q3 continue on, MIC_DET end keeps outputting high level to MIC signal in mute. For the electric charge of C13 C14 discharges quickly, after a period, MIC_DET end outputs negative voltage and MIC signal may output normally.

The delayed time may be changed through changing the RC constant of C14 C13 R17 R19.

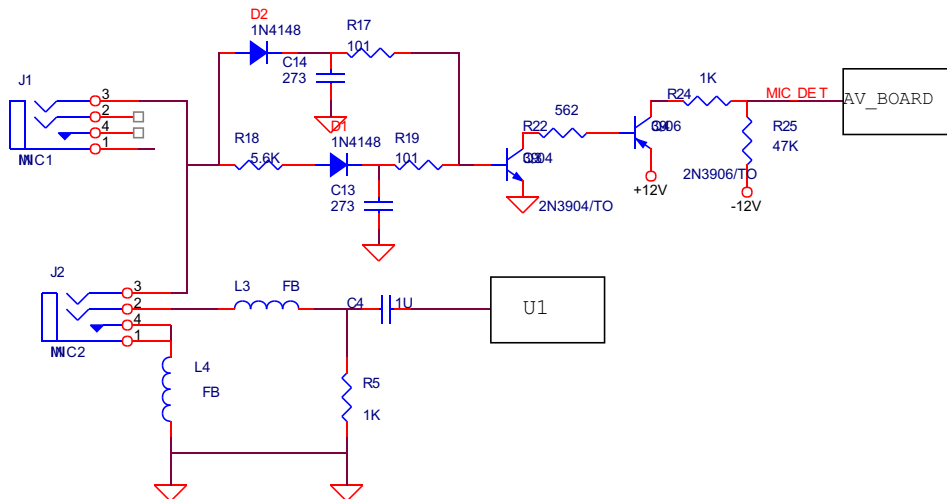

Figure 3.2.14.2 MIC mute circuit diagram

3. Amplifying circuit

Shown in the figure 3.2.14.3, the MIC signals inputted by MIC1, MIC2, through filtering circuit, input to pin 3 of U1 and then output from pin 1 after being amplified by U1A, input to potentiometer for volume adjustment, input to pin 5 of U1 for the second time amplification, R11 is feedback resistor and VR1 is potentiometer.

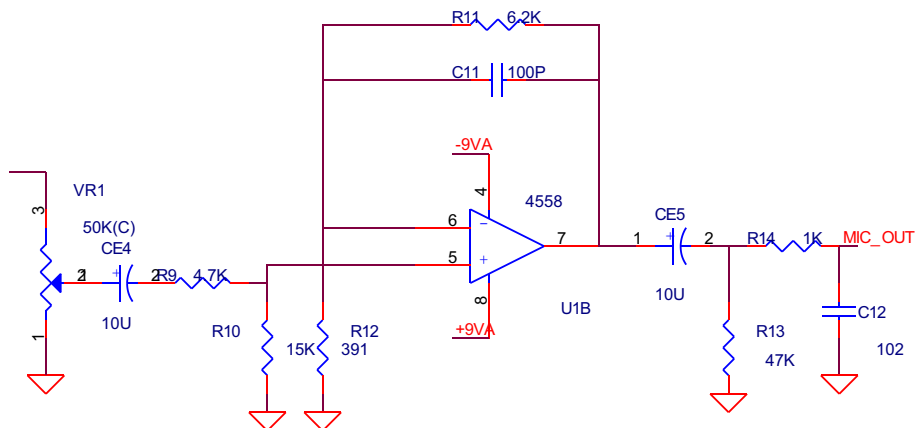

Figure 3.2.14.3 Amplifying circuit diagram

3.2.15 Power circuit

1. Power circuit block diagram is shown in the figure 3.2.15.1:

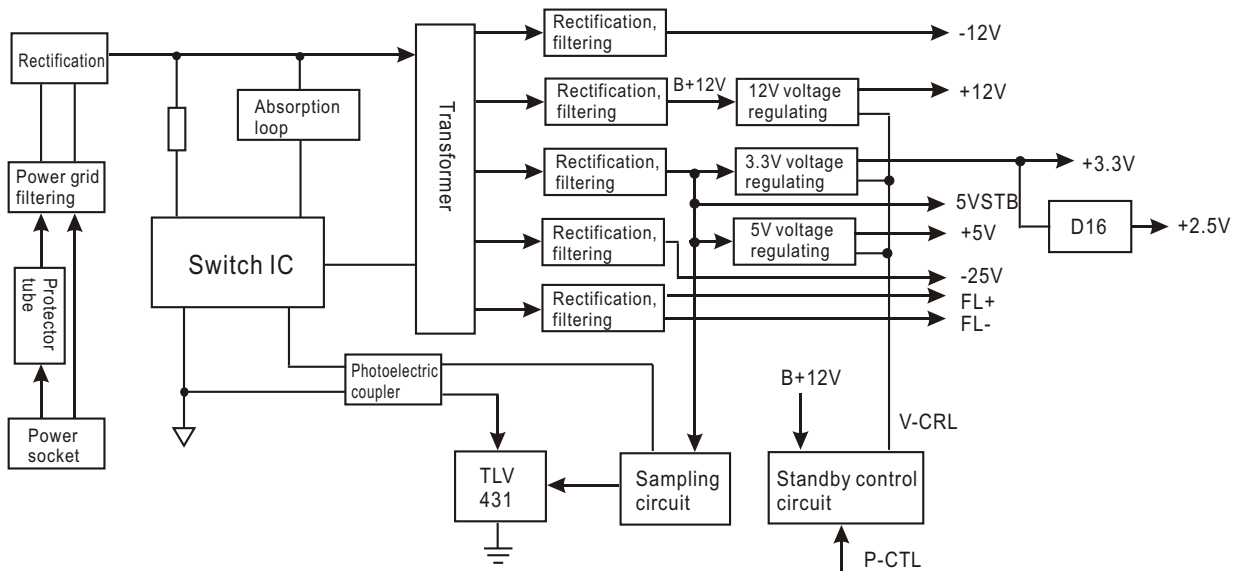

Figure 3.2.15.1 Power circuit block diagram

2. Working principle: after city power is inputted, through protection circuit and power grid filtering circuit, it directly enters the rectification circuit composed of D9~D12, in which protection circuit has over-voltage, over-current and temperature protection circuit. After being rectified, city power changes to DC current (the effective value is 1.4 times of city power, that is 300V) and is rectified by CE5. 300V power is divided into two ways: one way, through R6 voltage drop, is supplied to the start pin of switch module (IC1_6/IC6_4), the other way, through the 24 winding of transformer, arrives at the power pin of switch module (IC1_1/IC6_2) to make transformer perform the storage and discharge of energy through the internal switch pipe. When discharging energy, reverse peak voltage will produce, to prevent damaging the MOS pipe in switch module, the absorption loop protects MOS pipe. 6-7 winding is sampling winding, when the primary winding of transformer is discharging energy, the induction current forms between secondary winding and sampling winding, and induction voltage forms on the two ends of each secondary winding, after being rectified through secondary rectification diode, provides the required DC power for each circuit of the player. For power wave is large, to provide stable DC output, one winding of output end, after rectification and filtering (+5V or +3.3V generally), performs sampling, which is fulfilled by IC3 and the sampling circuit composed of the peripheral); when output voltage is on high side, IC3A K is on to make the light emission diode inside IC2 emit light to control the photo triode inside IC2, CE is on to change the space occupation ratio of switch pipe control end to make the output voltage become low, or else output voltage is on high side.

3. Working principle for standby switching to power on

Power-on standby: 5V_STB is supplied to panel IC13616 to make panel circuit begin working, display screen displays time, P_CTL pin of panel IC outputs low level to V_CRL end output low level, power of +3.3V +12V +5V cannot output (other power is normally supplied during this period), and machine enters standby status. After panel or remote controller inputs power-on instruction, P_CTL pin of UPD16316 outputs high level to make B+12V arrive at the switch control circuit of +3.3V, +12V, +5V through C-E electrode of Q9. Q2/Q7/Q11 is on, +3.3V +12V +5V output is normal, and the player enters working status.

4. Working principle

On/off control: when the player is in standby mode, P_CTL is low level, shown in the figure 3.2.15.2, Q6 cuts off to make Q9 cutoff, V_CRL end is low level, Q10 and Q11 cutoff, +12V has no power output, and the machine enters standby status. When power on, P_CTL is high level, Q6 is on, and Q9 is on at the same time, V_CRL end is high level, Q10 and Q11 are both on, +12V has power output and machine enters working status.

Voltage regulating principle: when output voltage is on high side, shown in the figure 3.2.15.2, the control pin voltage of IC4 (in normal conditions, control voltage, after R13/R12 partial voltage, is 2.5V) is on high side (more than 2.5V), cathode and anode of IC4 is on to make Q10, Q11 cutoff, now load power is supplied by CE16 discharge, after discharging, power is on low side, IC4 control pin voltage is on low side, anode and cathode disconnect, Q10 and Q11 resumes on status to supply power for load, this the repeat on/off course reaches the purpose of voltage regulating. V_CRL end also controls the switch control circuit of +5V +3.3V at the same time, and its on/off course and voltage regulating principle are the same with +12V. +5V is controlled by Ic3 and no voltage regulating circuit is added.

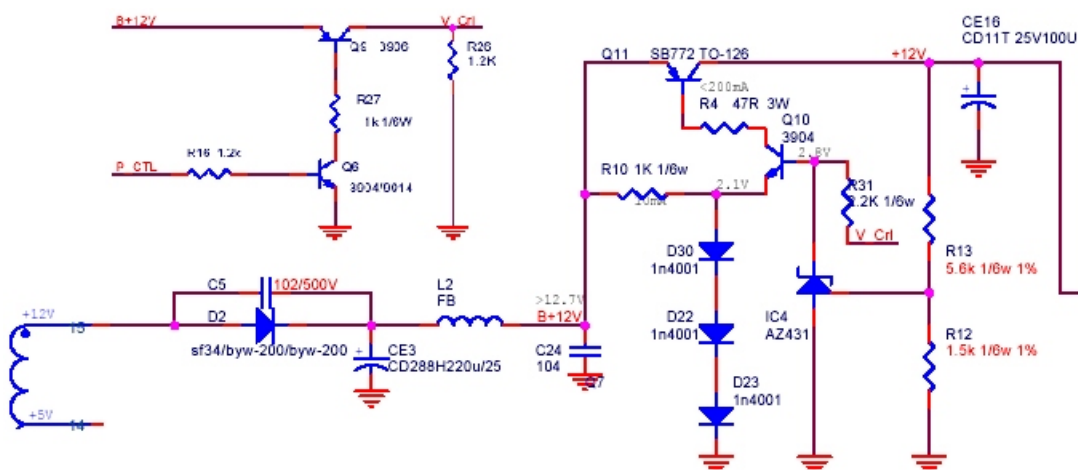

Figure 3.2.15.2 Switch control, voltage regulating circuit diagram

Section Three Servicing Cases

3.3.1 Servicing cases

[Example 1] Symptom: power not on

Description: after inserting power plug, power indicator light is not on, picture of the player has no output, panel has no screen display , panel buttons have no function.

Analysis and troubleshooting: according to trouble description, we can judge that trouble lies in power or decode part, use DC level of multimeter to test voltage of two ends of CE5, normal voltage is about 300V and test result is normal, then test pin 4 of IC6 and it is 0V, which is about 16V in normal conditions, after power off, use multimeter to test resistance to ground of pin 4 of IC6 and it is 0 ohm, after changing IC1 KA5L0380, trouble is removed.

[Example 2] Symptom: player not switch on

Description: after inserting power plug, power indicator light is on, press POWER button, power indicator light is off but the player has no power-on picture output

Analysis and troubleshooting: firstly test power supply and find that +3.3, +5V, +12V have no voltage output, so we preliminarily judge that trouble lies in standby control circuit. Shown in the figure 3.3.1.1, test V_CrI end and find that voltage is 0V, test P_CTL end and it is high level (normal), test Q9E electrode voltage and it is 13V, so we doubt that Q9 has trouble, after changing it, trouble is removed.

Figure 3.3.1.1 Standby circuit diagram

[Example 3] Symptom: machine down after power on

Description: after inserting power plug, power indicator light is on, picture of the player has output, but after pressing POWER switch, HELLO always displays and panel buttons have no function.

Analysis and troubleshooting: troubleshooting of this type of trouble is difficult; when loader, decode board, AV board, I2C bus and each voltage is abnormal, HELLO will display and the player will get down. It is easy to use substitution method to repair this type of machine. Firstly judge that which board has caused the trouble, then repair that board, which will be easier. Firstly use multimeter to test loader power supply 5V, 12V. When testing 12V, this voltage displays 0. This voltage is supplied by power board to AV board audio amplifying and loader. When checking this type of trouble, firstly use disconnection method, if rear stage is disconnected, load voltage restores to be normal, it means that trouble is caused by rear stage load; if load voltage is still 0, check power board; if voltage restores to be normal after disconnecting loader, it means that the short circuit of loader causes that there is 12V power supply, loader cannot start up, so machine will be down after power on; after changing loader, trouble is removed.

[Example 4] Symptom: no sound

Description: when playing DVD, switching external signal and receiving TV signal, there is no sound.

Analysis and troubleshooting: the reason to cause this trouble is that the common channel of sound is blocked. Use oscillograph to test AV board C33, C37 and there is audio signal output, but output terminal has no sound output. Because other channels also have no sound output, we preliminarily judge that trouble lies in mute circuit, use multimeter to test mute circuit and MUET is high level, which should be negative voltage when in normal playback, which means that mute circuit has started up. This mute circuit is divided into power-on mute and power-off mute circuit, if any one of the two has trouble, incorrect mute phenomenon will appear. After testing, we find that MUTE_1 end is high level (low level when playing normally, high level when power on), this signal is controlled by pin 47 of panel U1 (UPD16316), after changing IC (UPD16316), trouble is removed.

[Example 5] Symptom: no sound output when receiving TV signal

Description: when playing DVD disc normally or using external signal input, sound and picture output is normal. When switching TV signal input, image output is normal.

Analysis and troubleshooting: TV signal sound is outputted by pin 14 of AV board high frequency tuner to AV board U6 for NICAM processing, then outputted by pin 30, 31 of U6 and sent to U1 for switch input to decode board for audio processing. Use oscillograph to test pin 14 of AV board tuner and output is normal, pin 30, 31 of U6 has no waveform output, which means that this IC does not work normally, firstly test power supply of U6 and it is normal, test clock of U6 (two ends of X2 crystal oscillator have no oscillation waveform), after changing X2 (18.432MHZ crystal oscillator), trouble is removed.

[Example 6] Symptom: machine down

Description: after inserting power plug, power indicator light is on, picture of the player has no output, panel has no screen display, panel buttons have no function.

Analysis and troubleshooting: firstly test power supply conditions, and each group of power supply voltage is normal, then use substitution method: firstly judge which board has caused the trouble, then repair the trouble board. We use substitution method to judge that the trouble in main panel causes the machine down, which has the following aspects: clock is not correct, reset circuit cannot work normally, main panel U1 (UPD16316) cannot work normally, shown in the figure 3.3.1.2, use multimeter to check U1 (UPD16316) and voltage of each pin is normal, use oscillograph to test 5MHZ crystal oscillator and there is no oscillation frequency, after change the crystal oscillator with the same specification, trouble is removed.

Figure 3.3.1.2 Clock circuit diagram

[Example 7] Symptom: clock not saved

Description: after power off each time, screen of panel does not display the local time

Analysis and troubleshooting: this player is with RTC function, only when local time is well set, power on after power off each time, the local time will be kept. For this type of machine, we start from AV board RTC circuit troubleshooting, use oscillograph to test X1 32.768KHZ crystal oscillator, and there should be oscillation waveform when in normal conditions, but there is no waveform at this time, after changing crystal oscillator with the same specification, trouble is removed.

[Example 8] Symptom: picture of the player has mosaic when switching in external input

Description: when player is switching from normal playback to external signal input, TV picture appears disturbance, no external input image, but there is sound output.

Analysis and troubleshooting: according to trouble description, we can judge that trouble appears in externally-inputted video processing circuit, firstly test each power supply voltage of decode board U14 (TVP5150) and it is normal, use oscillograph to test clock signal of P5, P6, and pin 6 has no waveform output, but it should have 14.31818MHZ waveform output in normal working condition, after changing crystal oscillator with the same specification, trouble is removed.

[Example 9] Symptom: machine down when searching TV signal

Description: machine down each time when searching TV signal, that is, panel button and remote controller have no function

Analysis and troubleshooting: shown in the figure 3.3.1.3, machine will be down when receiving TV signal, and this trouble is in AV board high frequency tuner and its peripheral circuit, use multimeter to test voltage of power supply pin (pin 1) and I2C bus pin (pin 5, 6) of high frequency tuner and the real test value is that IIC bus pin voltage is 3.3V and tuner power supply pin (pin 1) voltage is 0V (power supply pin voltage is 5V and IIC bus pin voltage is 3.3V in normal conditions). According to circuit principle, power supply of frequency tuner is provided by power board, +5V is supplied to the power supply pin of high frequency tuner through (FB1), observe carefully and find that FB1 inductor has been broken to make high frequency tuner have no working voltage to make it cannot work, so machine down when searching channels, after changing elements with the same specification, trouble is removed.

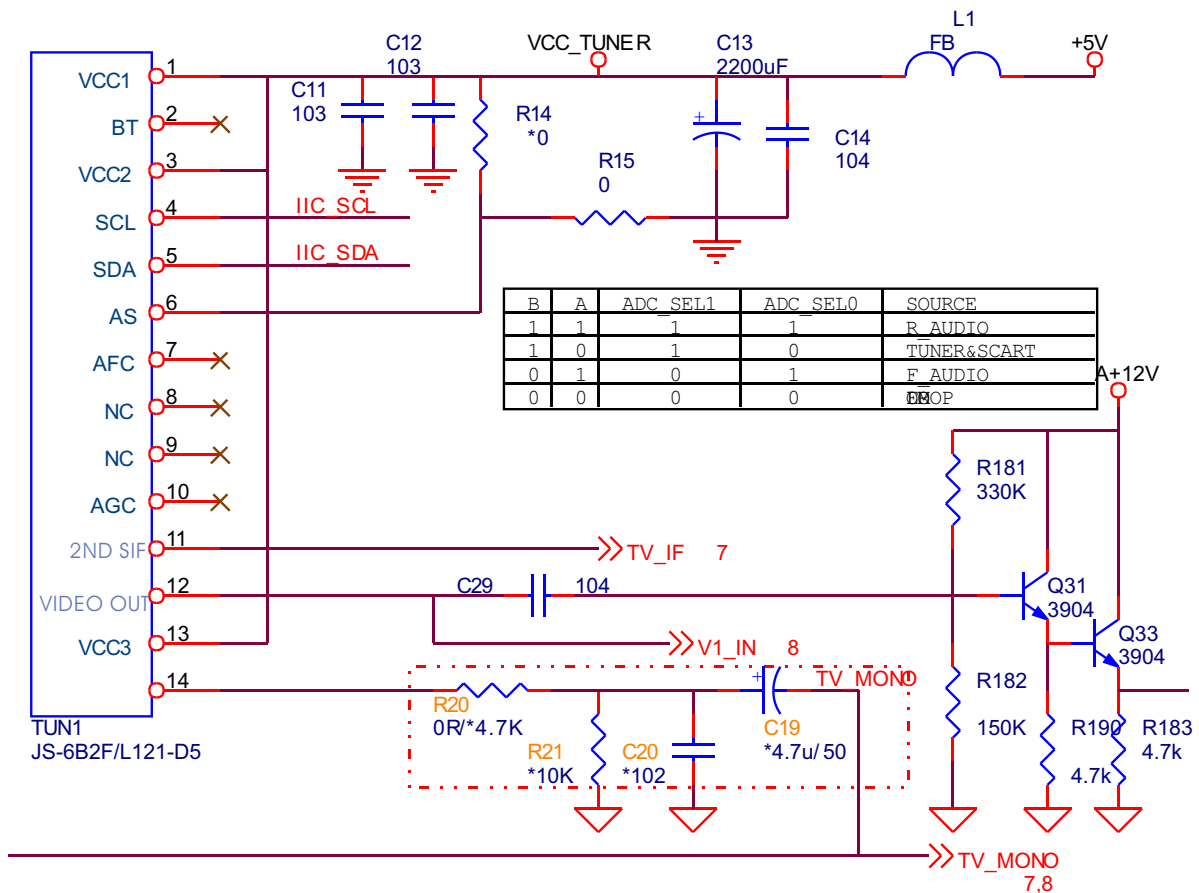

Figure 3.3.1.3 High frequency tuner circuit diagram

[Example 10] Symptom: no external sound

Description: when playing DVD, sound and picture are normal, when switching external, there is picture but no sound

Analysis and troubleshooting: this kind of trouble mainly lies in external input audio signal processing circuit. Check from rear stage circuit of AV board U1, switch the machine in rear audio input state, use oscillograph to test pin 3, 13 of AV board U1 and there is audio signal output, then test pin 10, 12 of decode board U17 (Cs5340) and there is also audio signal input, but pin 4 of U17 has no digital signal output. Test each pin voltage of U17 (Cs5340) and it is normal, so we doubt that U17 has trouble, after changing U17, trouble is removed.

[Example 11]Symptom: not read disc

Description: when reading DVD, VCD, CD, "NO DISC" displays

Analysis and troubleshooting: it is easy to adopt substitution method to check this type of trouble. Firstly use a good loader and computer flat cable to substitute the original loader and computer flat cable. After using loader component with the same specification to substitute, disc reading, playback and recording are all normal. (Loader component are all in one, change directly after damaging loader)

[Example 12]Symptom: DV cannot input

Description: other external inputs are normal, DV signal cannot input

Analysis and troubleshooting: firstly judge the location of PCB board in which trouble lies, test DV jack board flat cable position and check whether there is signal input, if there is signal input, the trouble lies in decode board. After testing, we find that trouble lies in DV board, so we doubt trouble lies in DV socket part, after changing DV socket, trouble is removed.

[Example 13]Symptom: no sound

Description: no sound when in external input and playing DVD player

Analysis and troubleshooting: we judge that trouble lies in audio processing circuit, test pin 2 of U15 and there is signal input, clock and power supply of U15 are both normal, test U15 audio output pin and find that there is no analog audio signal output, so we doubt that U15 has trouble, firstly weld U15 again, trouble disappears, so the rosin joint of IC leads to it after confirmation. Conclusion: before changing IC, weld IC again firstly to avoid incorrect judgment.

[Example 14]Symptom: player not switch on

Description: after power on, standby indicator light is on, press POWER button, indicator light cannot turn out, and the player cannot enter power-on state.

Analysis and troubleshooting: according to trouble symptom, we can judge that trouble lies in panel, test P_CTL_PSW pin and there is no high level output, test STB_5V voltage and it is normal, so we doubt that power button has trouble, after changing it, trouble is removed.

[Example 15] Symptom: component video output picture has distortion

Description: the output picture has no red

Analysis and troubleshooting: it is judged that trouble is in red fundamental color output circuit, shown in the figure 3.3.1.5, test C65 and there is signal output, test R89 and there is no signal output, so we doubt that amplifying circuit has trouble, after changing Q13, trouble is removed.

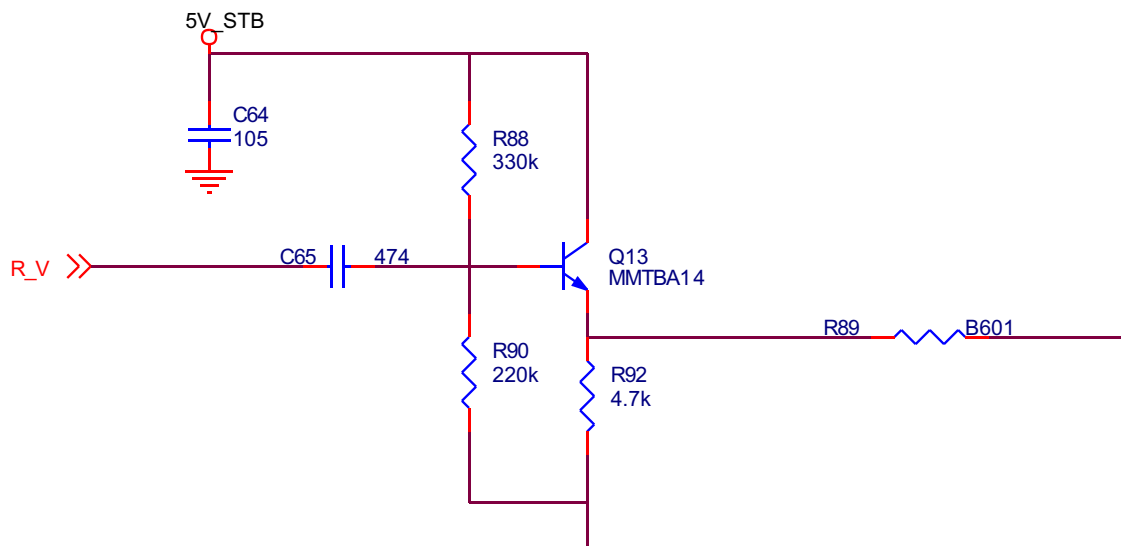

Figure 3.3.1.5 Component video output circuit

3.3.2 Troubleshooting flow chart

1. Troubleshooting process for “DV has no output” is shown in the figure 3.3.2.1:

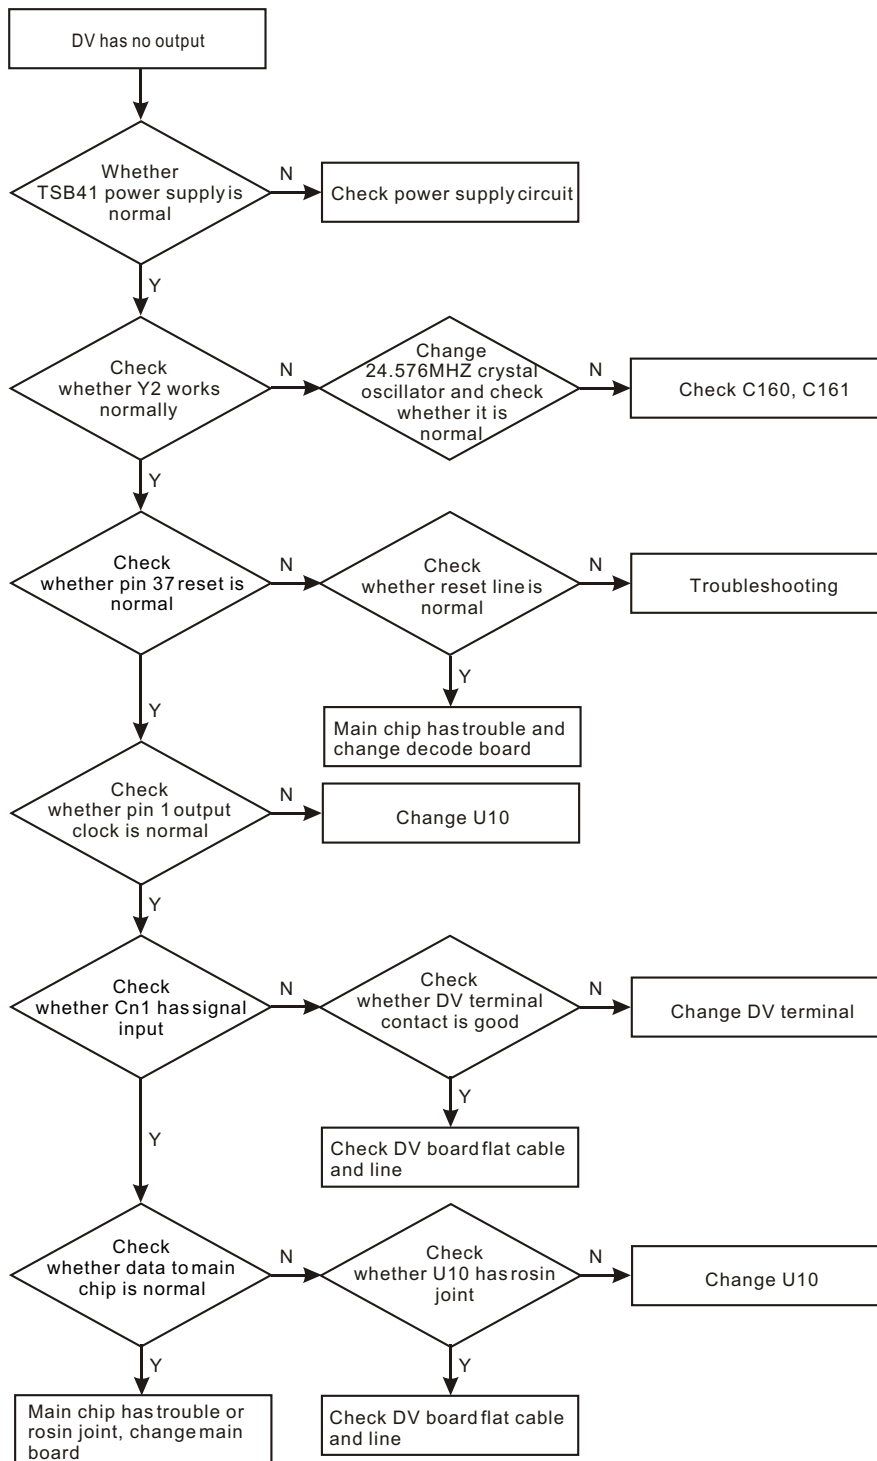

Figure 3.3.2.1 “Troubleshooting flow chart for “DV has no output”

2. Troubleshooting process for “Not read USB device” is shown in the figure 3.3.2.2:

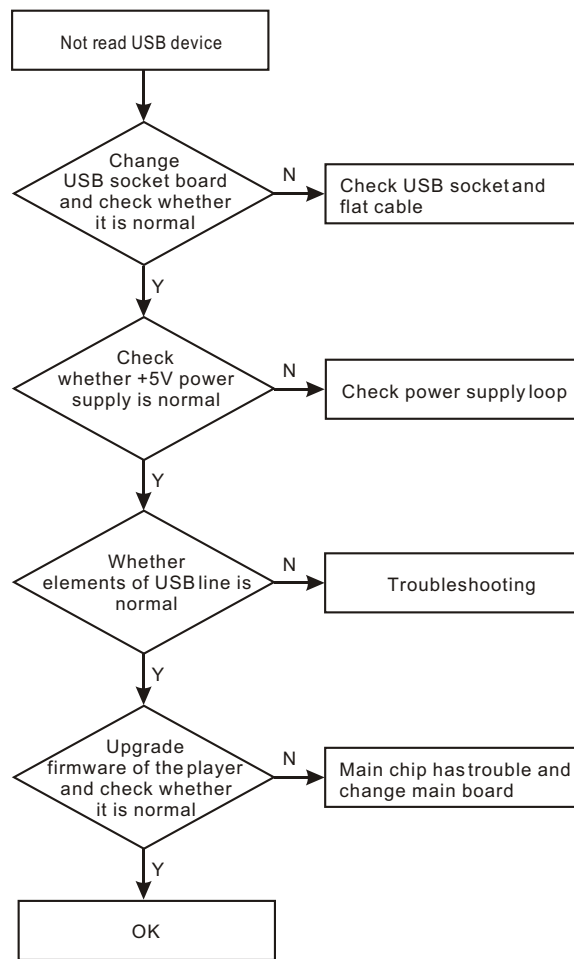

Figure 3.3.2.2 Troubleshooting flow chart for “Not read USB device”

3. Troubleshooting process for “Power not on” is shown in the figure 3.3.2.3;

Figure 3.3.2.3 Troubleshooting flow chart for “Power not on”

4. Troubleshooting process for “Cannot enter power-on from standby” is shown in the figure 3.3.2.4:

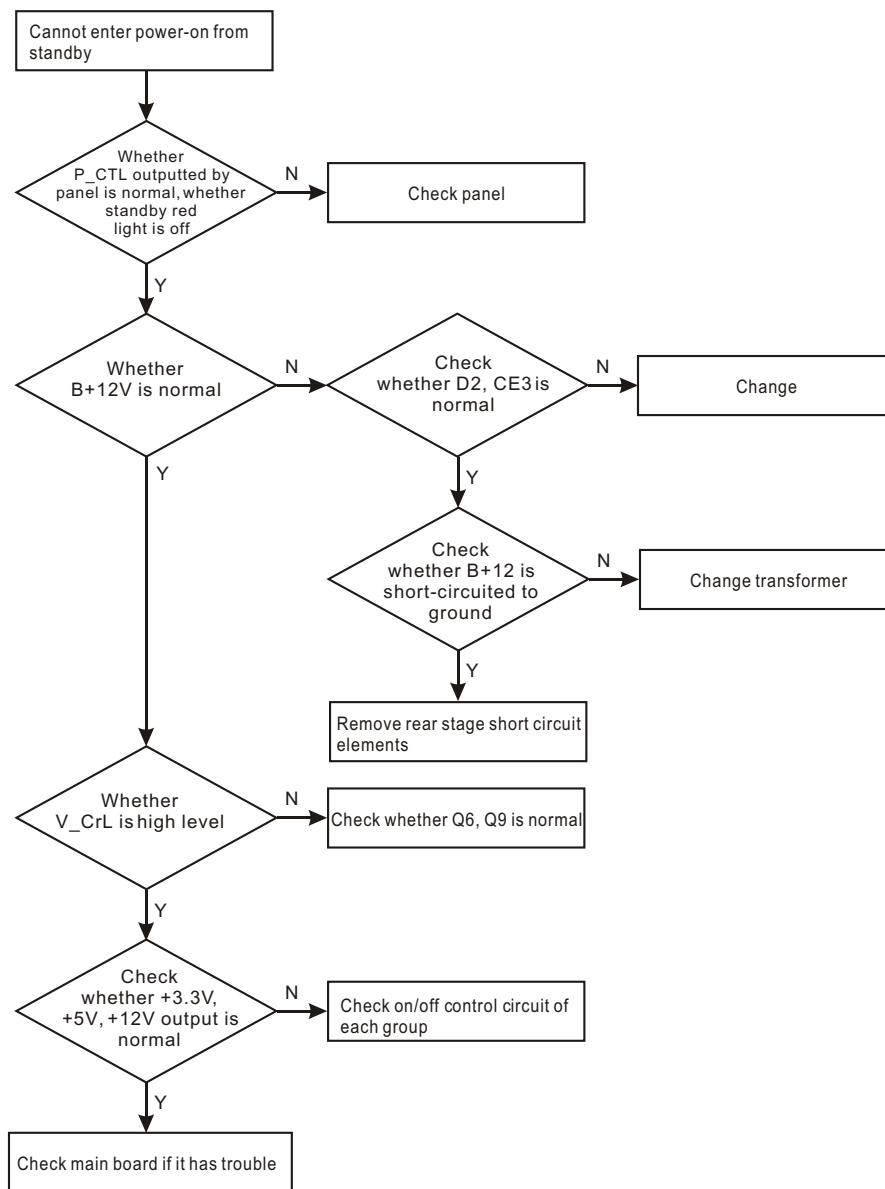

Figure 3.3.2.4 Troubleshooting flow chart for “cannot enter power-on from standby”

5. Troubleshooting process for “No display” is shown in the figure 3.3.2.5:

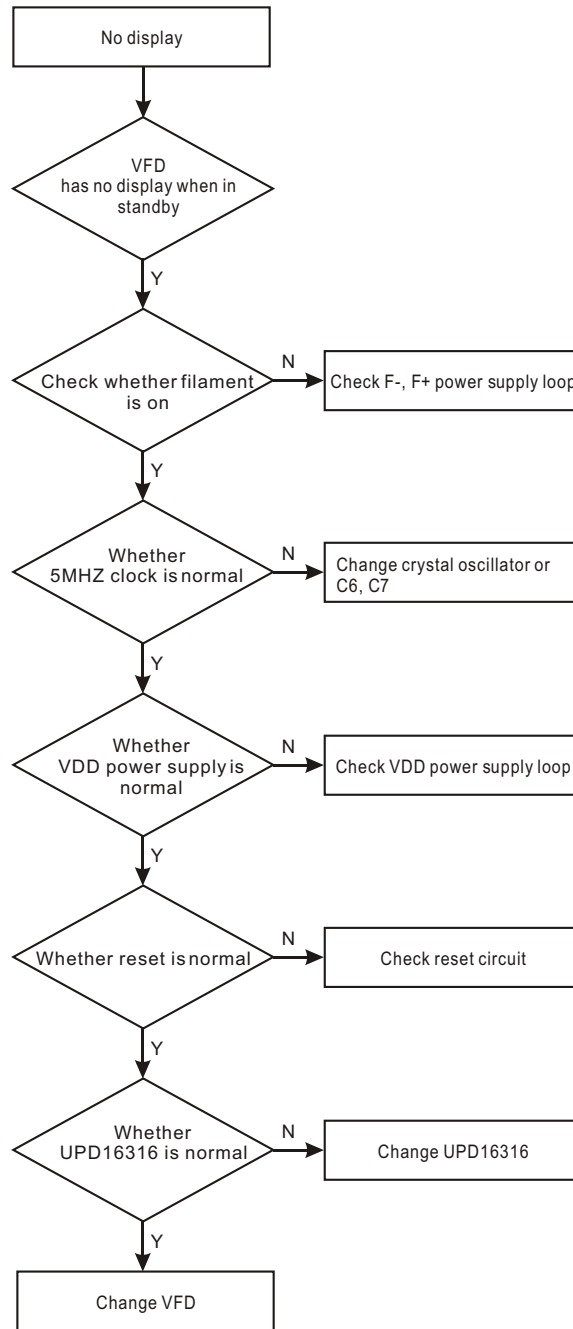

Figure 3.3.2.5 Troubleshooting flow chart for “No display”

6. Troubleshooting process for “+12V has no voltage output” is shown in the figure 3.3.2.6:

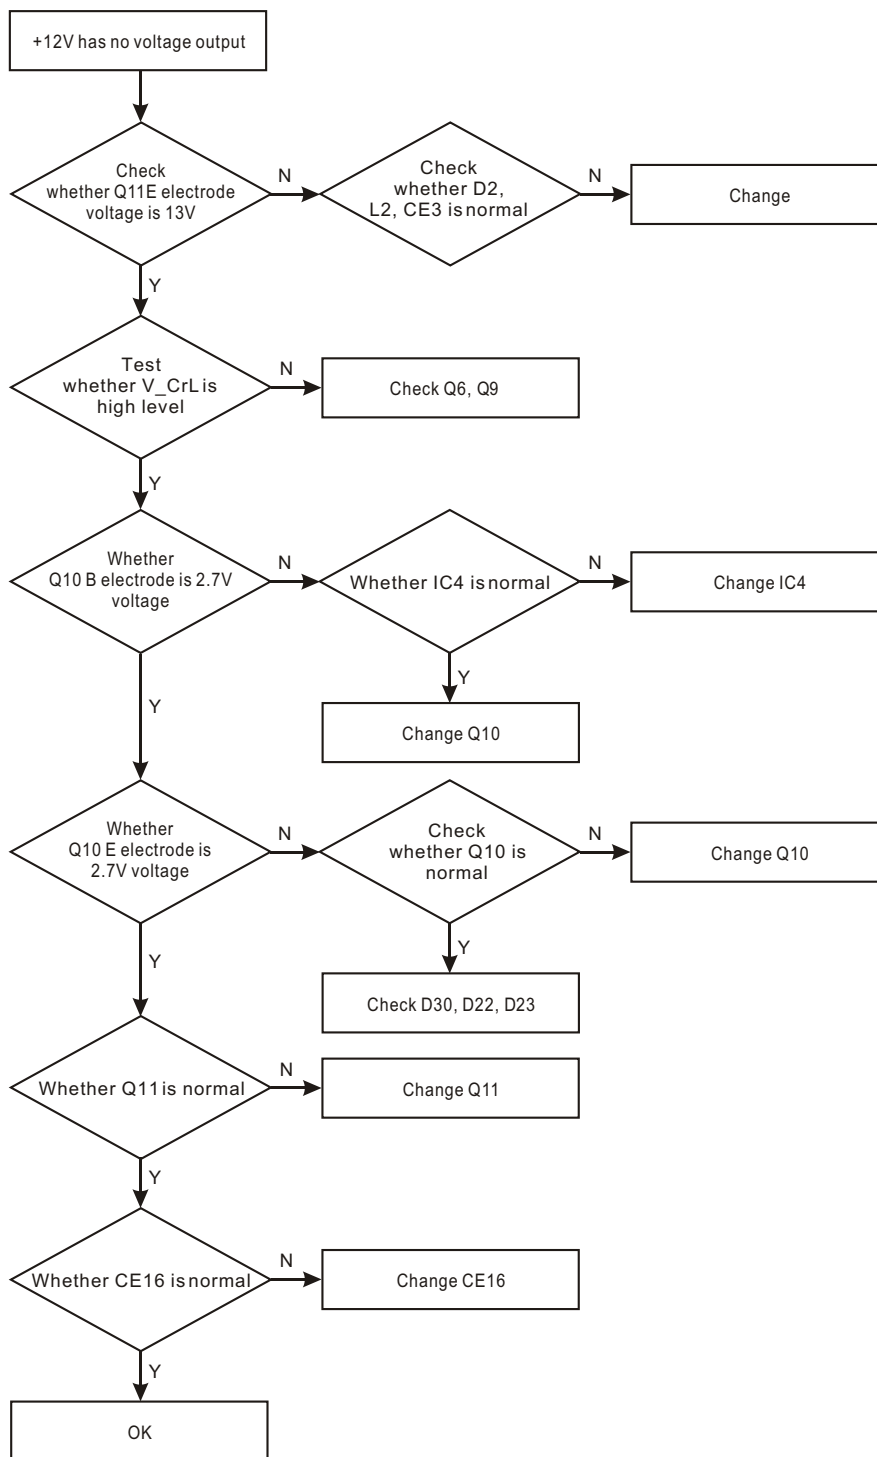

Figure 3.3.2.6 Troubleshooting flow chart for “+12V has no voltage output”

7. Troubleshooting process for “External input has no sound output” is shown in the figure 3.3.2.7:

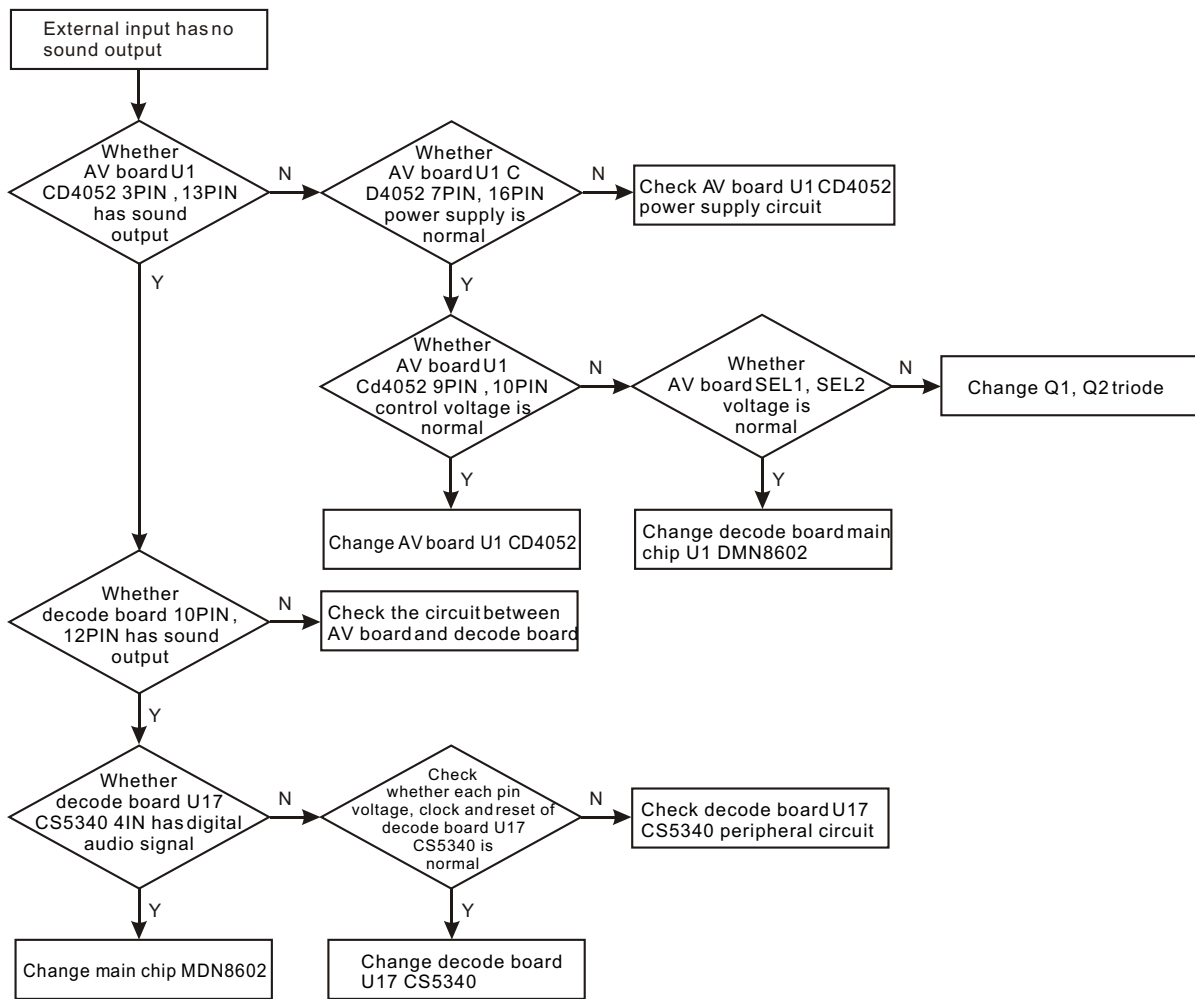

Figure 3.3.2.7 Troubleshooting flow chart for “External input has no sound output”

8. Troubleshooting process for “TV signal has no sound output” is shown in the figure 3.3.2.8:

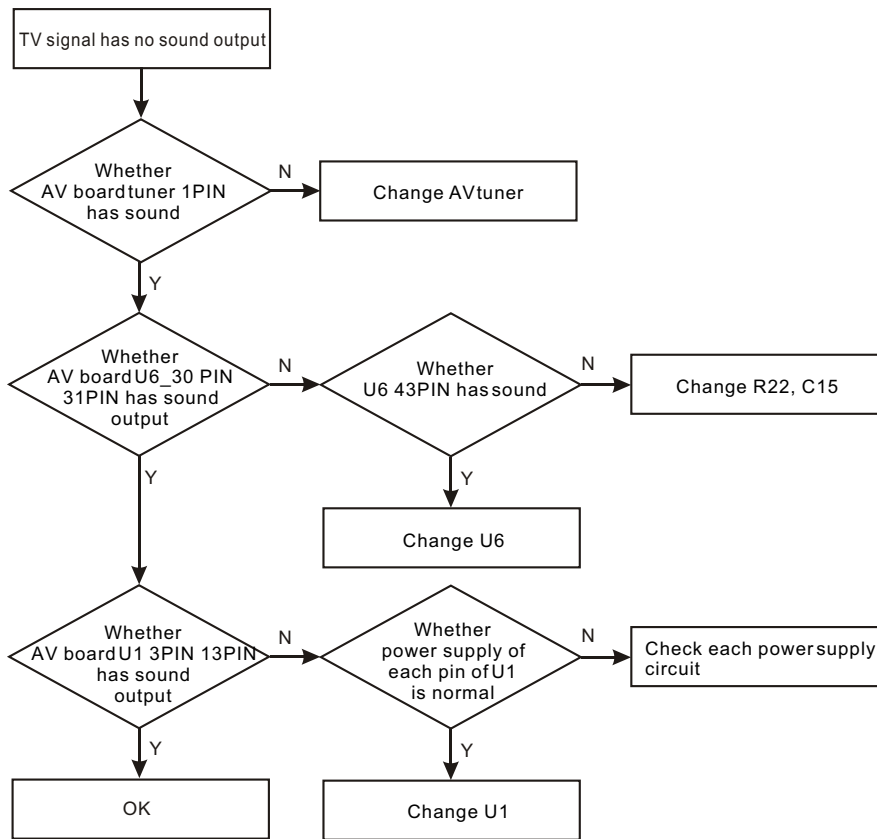

Figure 3.3.2.8 Troubleshooting flow chart for “TV signal has no sound output”

9. Troubleshooting process for “TV signal input has no image” is shown in the figure 3.3.2.9:

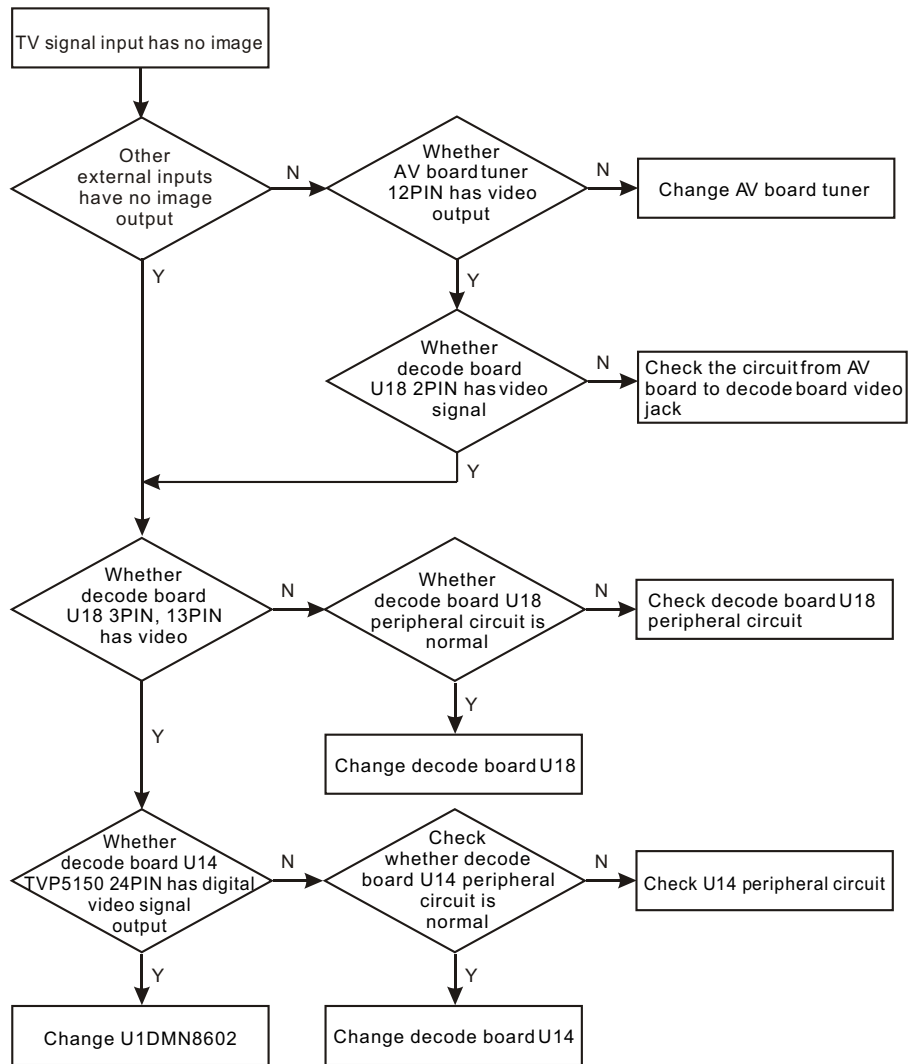

Figure 3.3.2.9 Troubleshooting flow chart for “TV signal input has no image”

10. Troubleshooting process for “Cannot receive TV signal” is shown in the figure 3.3.2.10:

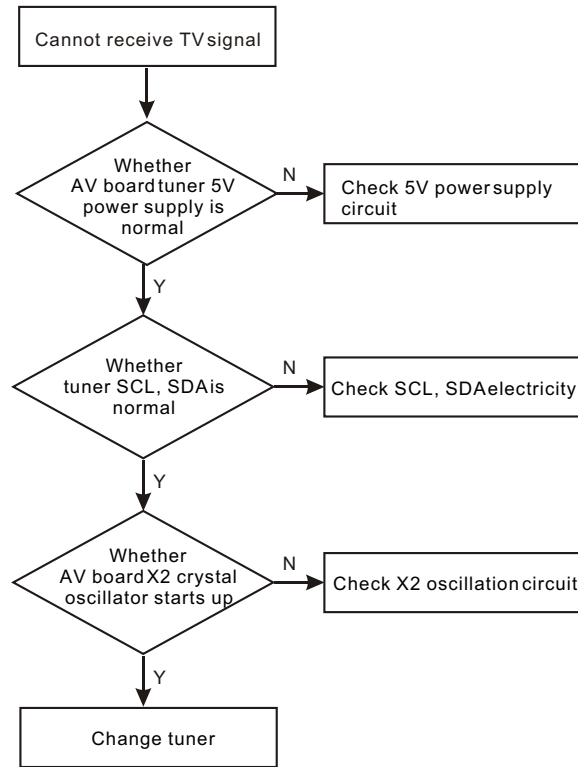

Figure 3.3.2.10 troubleshooting flow chart for “Cannot receive TV signal”

11. Troubleshooting process for “No sound when playing disc” is shown in the figure 3.3.2.11:

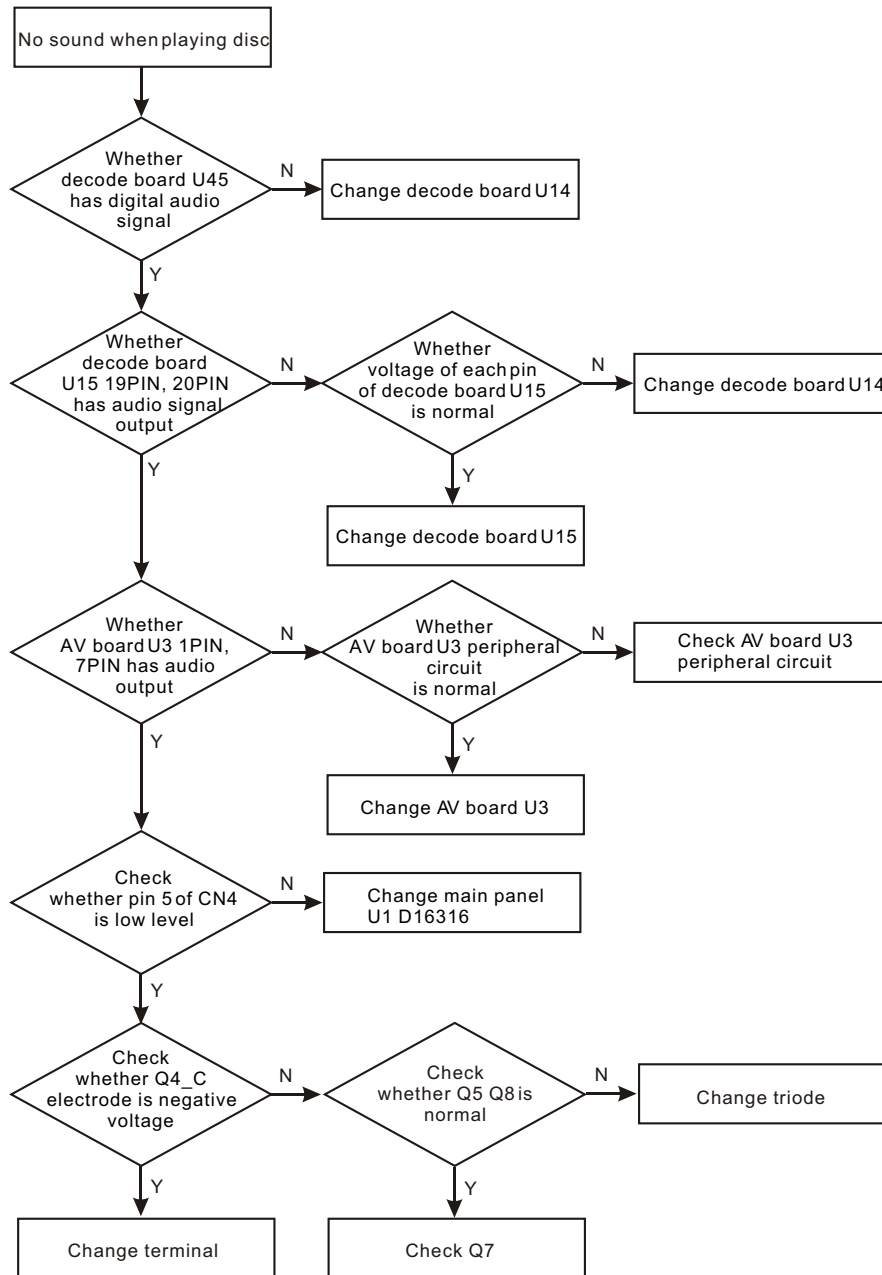

Figure 3.3.2.11 Troubleshooting flow chart for “No sound when playing disc”

12. Troubleshooting process for “External input picture has mosaic” is shown in the figure 3.3.2.12:

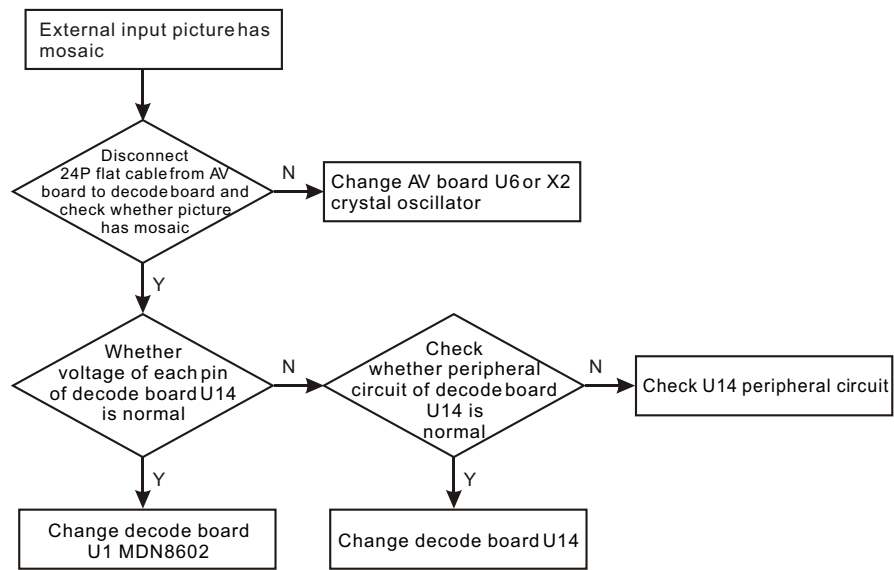

Figure 3.3.2.12 Troubleshooting flow chart for “External input picture has mosaic”

13. Troubleshooting process for “Machine down after power on” (there is power-on picture but no button function) is shown in the figure 3.3.2.13:

Figure 3.3.2.13 Troubleshooting flow chart for “Machine down after power on”

14. Troubleshooting process for “The player has no output” (no power-on picture and no button function) is shown in the figure 3.3.2.14:

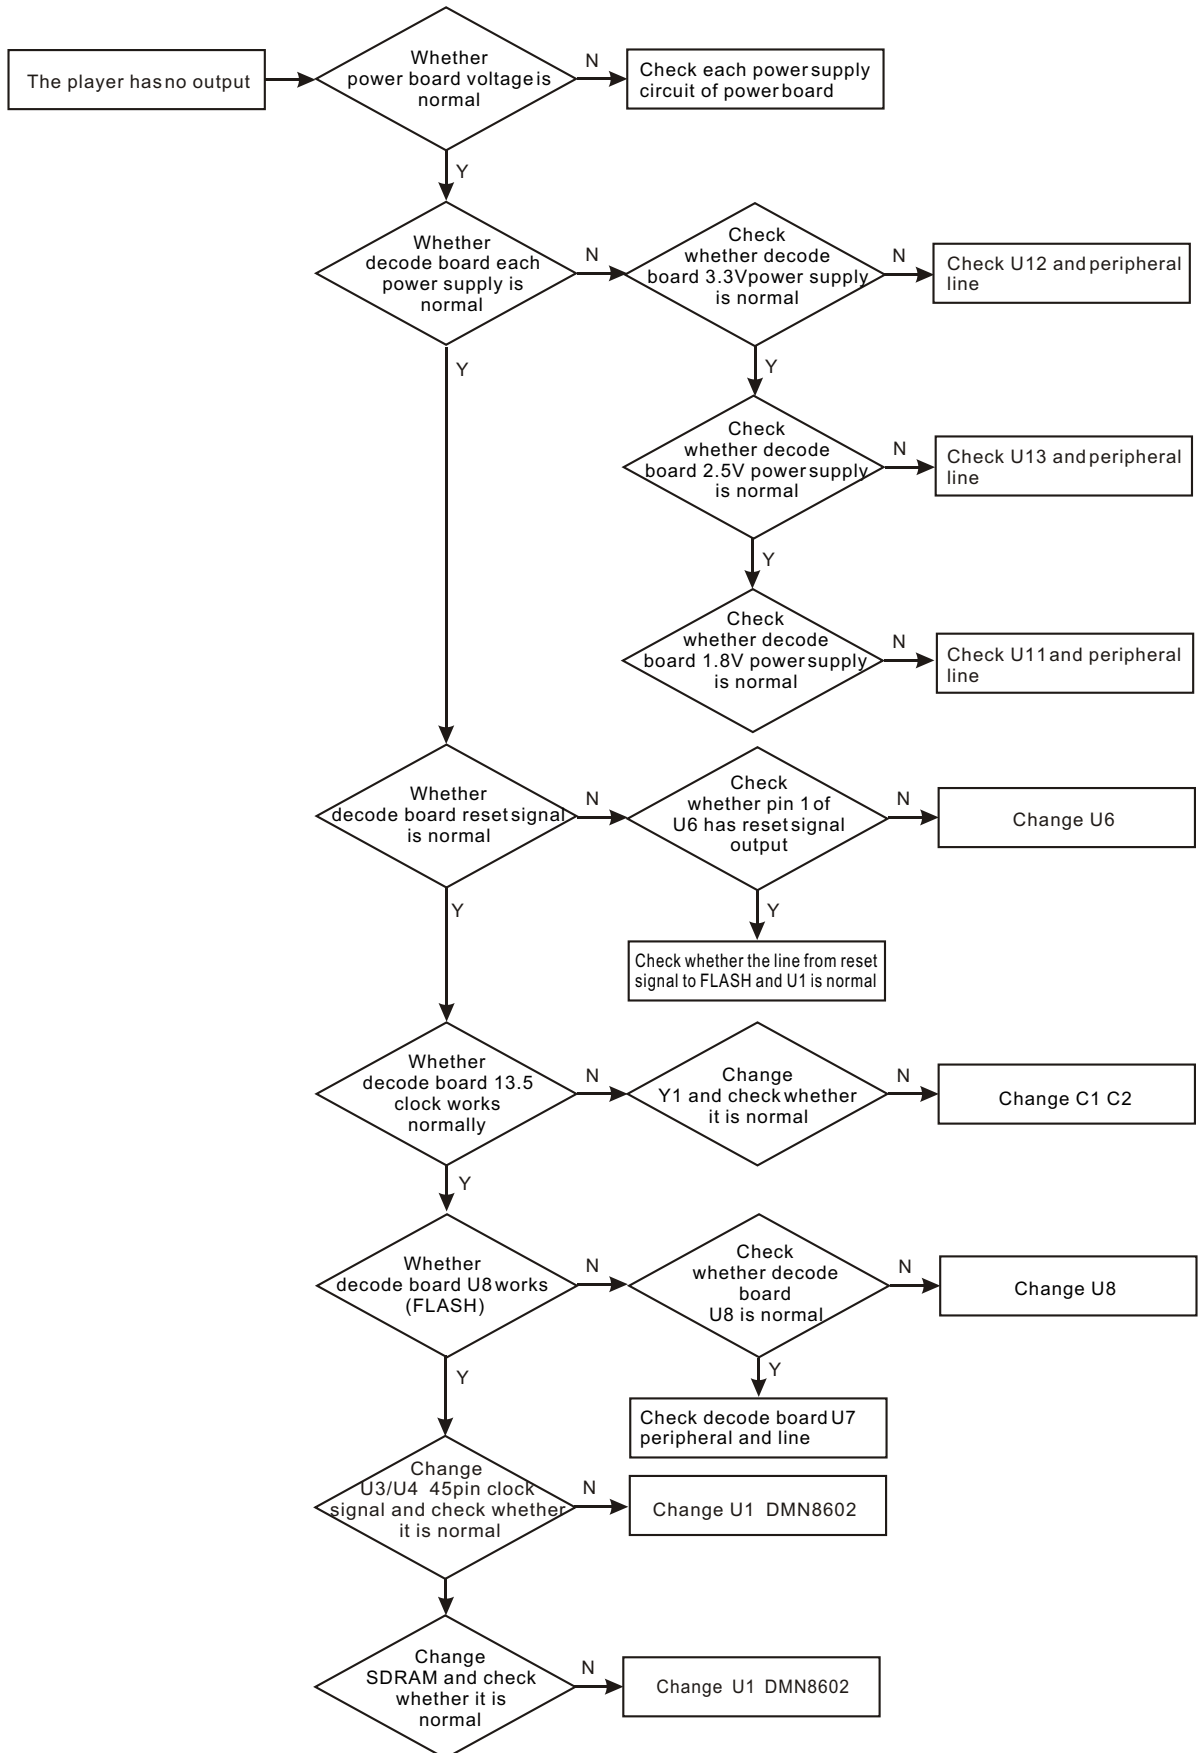

Figure 3.3.2.14 Troubleshooting flow chart for "The player has no output"

Section Four Servicing Parameters

3.4.1 Signal waveform diagram

This section collects signal waveform diagram of audio, video and each unit circuit with the purpose to help servicing personnel to judge where trouble lies in accurately and quickly to improve servicing skills. For the difference of oscillograph's type, model and tuner, a certain difference may exist, so the servicing personnel are expected to pay more attention to check in daily operation.

1. Panel main clock (5MHZ) test point U1_51 peak value 3.64V

2. Externally connected crystal oscillator of panel clock signal (32.766KHZ) test point U1_2 peak value 3.16V

3. VFD_CLK decode board clock signal waveform, test point, panel flat cable position

4. SDRAM clock signal waveform diagram test point U3_45 U4_45 peak value 736MV frequency 150MHZ

5. SPDIF_OUT signal waveform diagram test point U5_12 peak value 6.56V

6. System reset signal waveform diagram test point 3.3V power and U5_4

7. Video coder clock waveform diagram test point U14_5 peak value 1.46V frequency 14.3MHZ

8. Main clock signal waveform (13.5MHZ) test point Y1 peak value voltage 1.44V

9. Waveform of digital audio signal (AO_D1) outputted by decode chip, when in 5.1CH output, AO_DI/AO_D3 and AO_D1 are the same, test point U15_4 peak value 4.04V test point U15_4

10. AO_SCLK bit clock signal peak value 4.12V voltage 1.64V test point U15_5

11. AO_FSYNC left/right clock signal peak value 3.52V voltage 1.63V test point U15_6

12. AO_MCLKO main clock signal peak value 4.16V voltage 1.66V test point U15_7

Section Five Function Introduction to IC

3.5.1 function introduction to MT 8602

1. Description

The DMN-8602 accepts video from broadcast TV and other analog video sources, and compresses and formats the video for storage on DVD in industry-standard recordable formats (DVD-RAM, DVD-RW/R, DVD+RW/R). The DMN-8602 allows half-duplex operation (record or play back) or full-duplex operation (simultaneous record and playback – time shifting) with only a change of memory configuration. The device permits control of DV camcorders connected via FireWire using the AV/C protocol, and transcodes DV-25 video for storage on DVD. The DMN-8602 also supports leading-edge DVD playback features.

The DMN-8602 supports video compression and decompression in compliance with the MPEG-1, MPEG-2, and DV-25 specifications. It also transcodes between DV-25 and MPEG-2. The product supports corresponding audio compression and decompression in compliance with the Dolby Digital CE and MPEG-1 layer 2 specifications.

The DMN-8602 supports the playback of DVD-Video disks with Dolby Digital 5.1 and DTS audio encoding, DVD Audio disks (MLP), VCD, and SVCD disks. DMN-8602 also supports the play back of audio encoded in MP3 and WMA formats, and the display of pictures encoded in JPEG format.

The DMN-8602 integrates a RISC processor dedicated to video processing that, coupled with a dedicated video digital signal processor and motion estimation engine, enables the handling of multiple advanced-image processing tasks. The DMN-8602 also integrates a RISC processor dedicated to system-level processing and all audio processing tasks. The DMN-8602 supports industry standard audio encoding and decoding formats, as well as audio post-processing tasks such as 3D audio effects and bass management functions.

This combination allows the DMN-8602 to simultaneously handle multiple A/V processing functions while managing all system control tasks, eliminating the need for an external host CPU.

The DMN-8602 has an on-chip ATAPI controller that supports DVD-RAM, DVD-RW/R, and DVD+RW/R recordable DVD drives. The DMN-8602 integrates an analog video encoder, and provides built-in support for simultaneous progressive and interlaced video output. A 1394 link layer function is integrated, requiring only a simple external physical layer device. One USB port is provided, as well as support for PCMCIA 2.1 cards with minimal logic.

The DMN-8602 integrates a RISC processor dedicated to video processing that, coupled with a dedicated video digital signal processor and motion estimation engine, enables the handling of multiple

advanced-image processing tasks. The DMN-8602 also integrates a RISC processor dedicated to system-level processing and all audio processing tasks. The DMN-8602 supports industry standard audio encoding and decoding formats, as well as audio post-processing tasks such as 3D audio effects and bass management functions. This combination allows the DMN-8602 to simultaneously handle multiple A/V processing functions while managing all system control tasks, eliminating the need for an external host CPU.

2. Features

Digital video	A/V Encode/Decode	Multiformat audio and video encode/decode
	Transcoding/rating	Multiformat transcoding, multirate transrating
	Resolutions	Horizontal: 720, 704, 640, 544, 480, 352 Vertical: NTSC (480i, 480p) and PAL (576i)
	Formats	NTSC, PAL, ITU-R BT.656/601, SMPTE 260M
	Input	8- or 10-bit digital video from ITU-R BT.656 (parallel D1) sources; A single 8-bit digital video stream (SMPTE 260M) at 27 MHz
	Output	Single 8-bit ITU-R BT.656 interlaced video output.
Audio	Output	Baseband composite (M) NTSC or (B,D,G,H,I) PAL analog video. Separate analog Y/C outputs to support S-video. Separate analog component video RGB or SMPTE YpbPr outputs.
	Input	Single stream input, supporting common audio formats, including I2S, with four input channels
	Output	Single stream output, supporting common audio formats, including I2S with eight output channels
	Resolutions	16 to 32 bits/sample
	Analog Audio Sampling Frequency	32, 44.1, 48, and 96 kHz output
	Digital Audio Sampling Frequency	8- to 192 kHz over IEC-958
I/O	Serial	IEEE1394, IDC, SPI, IR receive, IR blaster, dual UARTs
	Parallel	ATAPI
	USB1.1	Host low speed and full speed interface. A single port is available for down stream hub or device connection.
System	Host	16/32-bit generic host interface or internal host
	Graphics	2D, 24-bit RGB, 8-bit alpha channel, OSD, flicker filter and video scaler
	Encryption/decryption	CPRM, CPPM, CSS, 5C (via 1394), Watermark detection
Memory	Memory	8-256 Mbytes of SDRAM, SDR or DDR

	Controller	On-chip, 32-bit-wide SDRAM interface, 148.5 MHz
	Peak Bandwidth	1.2 Gbytes/s
Physical	Input Voltages	3.3 V I/O; 1.8 V Core; 2.5 / 3.3 V SDRAM; 3.3 V Isolated Analog
	System Clock	13.5 or 27 MHz
	Operating Power	< 2.7 W @ Vdd = 1.8 V typical
	Package	308-Pin Ball Grid Array (BGA)
JTAG	Compliance	IEEE 1149.1 compliance for boundary scan testing and board assembly testing

3. Signal Descriptions

System Services	CLKI	I	This input provides the timing reference for internally generated DMN-8602 clocks.
	CLKX	I	Connected to the second pin of the 13.5 MHz crystal.
	CLKO_DAC	O	The output of the internal 13.5 MHz crystal oscillator or output a train of digital pulses controlled by the TC Sigma-Delta DAC Control Register (TCdacCtl).
	BYPASS_PLL	I	Bypasses the PLL used to generate the internal processing clock
	#RSEO	O	Reset Out.
	#EPD	O	External Power Down.
	USB_48MHz	I	
1394/ Firewire (Bitstream I/O)	1394_PHY_DATA[7:0]	I/O	Data 0 through data 7 of the phy-link data-bus.
	1394_PHY_CTL[1:0]	I/O	Control 0 and 1 of the phy-link control bus.
	1394_LREQ	O	Link Request.
	1394_LPS	O	Link Power Status.
	1394_LINK_ON	I	Occurrence of a link-on event.
	1394_PHY_CLK	I	PHY_CLK is the 49.152MHz clock supplied by the PHY device.
SDRAM Interface	SDRAM_CLK[1:0]	O	Clock. These outputs are buffered versions of the internal DMN-8602 clock.
	#SDRAM_CLK[1:0]	O	Clock. Differential clock.
	SDRAM_CKE	O	Clock Enable.
	#SDRAM_CAS	O	Column Address Strobe.
	#SDRAM_RAS	O	Row Address Strobe (Activate).
	SDRAM_DQM[3:0]	O	Data Mask (Byte Enables).

	SDRAM_A[17:0]	O	Address, Bank Select, Chip Select.
	SDRAM_DQ[31:0]	I/O	Read / Write Data.
	#SDRAM_WE	O	Write Enable.
	SDRAM_DQS[3:0]	I/O	SDRAM Data Strobe.
	#SDRAM_VREF	I	Reference voltage for SSTL.
Video I/O Interface	VI_CLK	I	Video Input Clock.
	VI_D[9:2]	I	Video Input Data.
	VO_D[7:0]	O	Video Output Data.
	VI_VSYNC	I	Video Input Vertical Sync.
	VO_CLK	I/O	Video Output Clock.
	DAC_OUT[6:1]	I	Analog Video DAC output.
IDC Serial I/O)	SIO_SDA	I/O	IDC clock (open drain).
	SIO_SCL	I/O	IDC data (open drain).
Boundary Scan (JTAG)	#TRST	I	Test Reset
	TDO	O	Test Data Out
	TDI	I	Test Data In
	TMS	I	Test Mode Select
	TCK	I	Test Clock
USB	Dplus	I/O	This is the USB transceiver port differential D+ and D- signals.
	Dminus]	I/O	
	Host_OC	I	This is the USB transceiver port 0 power enable for the external USB power management chips.
	Host_PO	O	This is the USB transceiver port 0 over-current status signal from the external USB power management chips.
UART[2:1] (Serial I/O)	SIO_UART[2:1]_TX	I	UART clear to send.
	SIO_UART[2:1]_RX	O	UART receive.
	SIO_UART[1]_RTS	I	UART request to send.
	SIO_UART[1]_CTS	O	UART transmit.
IR (Serial I/O)	SIO_IRTX1	I	IR transmit 1.
	SIO_IRTX2	O	IR transmit 2
	SIO_IRRX	O	IR receive input.
SPI (Serial I/O)	SIO_SPI_CLK	O	SPI clock.
	SIO_SPI_MOSI	O	SPI master out slave in.
	SIO_SPI_MISO	I	SPI master in slave out.

	SIO_SPI_CS[2:0]	O	SPI chip selects.
ATAPI 1 (Bitstream I/O)	ATAPI_RESET	O	DMN-8602 reset of connected ATAPI devices.
	ATAPI_DATA[15:8]	I	ATAPI_DATA is the bidirectional data bus.
	ATAPI_ADDR[4:0]	I	Device register address.
	#ATAPI_DIOW	I	ATAPI I/O write request.
	#ATAPI_DIOR	O	ATAPI I/O read request.
	ATAPI_INTRQ	O	ATAPI device interrupt request.
	ATAPI_IORDY	I	ATAPI device IO ready.
	ATAPI_DMARQ	I/O	ATAPI device DMA request.
	#ATAPI_DMAACK	O	ATAPI DMA acknowledgement.
Host Interface	HMST_GPIO[6:0]	I/O	General purpose dedicated I/O [6:0].
	#HMST_RST	I	Master Reset signal.
	#HMST_CS[10:0]	O	Master chip select [10:0] outputs.
	M_Addr[26:22]	O	Most significant five host address bits [26:22].
	M_Addr[21:6]/M_Data[15:0]	I/O	Host address bus bits [21:6]./ Host data bus.
	M_Addr[5:1]	O	Least significant five host address bits [5:1]
	#HMST_UWE, HMST_UDS	O	Master upper data strobe (68K-mode).
	#HMST_RD/WR, HMST_LWE	O	Master data transfer direction (68K-mode).
	#HMST_OE, HMST_LDS	O	Master lower data strobe (68K-mode).
	#HMST_ALE	O	Master address latch enable.
	#HMST_WAIT	I	Master wait signal from peripheral.
	#HMST_DTACK	I	Master data transfer acknowledge.
	HMST_CS0_8BIT	I	Set host CS[0] to 8-bit mode in master mode.
	#PCMCIA_IOR	I	PCMCIA I/O read.
	#PCMCIA_IOW	I	PCMCIA I/O write.
Audio I/O Interface	AI_SCLK	I/O	Serial audio bit clock for the audio input stream.
	AO_SCLK	O	Serial audio bit clock for the audio output stream.
	AI_MCLKO	O	Audio Master Input Clock output for the internally generated master input clock.
	AI_MCLKI	I	Audio Master Input Clock input for an externally generated master input clock.
	AO_MCLKO	O	Audio Master Output Clock output for the internally generated master output clock.

	AO_MCLKI	I	Audio Master Output Clock input for an externally generated master output clock.
	AI_D[1:0]	I	Audio Input Data.
	AO_D[3:0]	O	Audio Stream Output Data.
	AI_FSYNC	I/O	AI_FSync determines the start or end of the next stream input sample
	AO_FSYNC	O	AO_FSync determines the start or end of the next stream output sample
	AO_IEC958	O	IEC-958 Interface Output.

3.5.2 Function introduction to CD4053

CD4053 is a 4-group 2-channel data selection device, and is mainly used in the input, output selection of SCART and the realization of LOGO function in DVD recorder. Each pin function is shown as follows:

Pin	Name	Function	Remark
1、 2	Y1、 Y0	Y signal input	I
13、 12	X1、 X0	X signal input	I
3、 5	Z1、 Z0	Z signal output	I
6	EN	Enable end: low level effective	I
7	VEE	-6.2V power	
8	GND	ground	
16	VCC	+5V power	
9、 10、 11	C、 B、 A	Gating signal control input	I
14	X	X signal output	O
15	Y	Y signal output	O
4	Z	Z signal output	O

A, B signal strobe condition:

A、 B、 C	X、 Y、 Z	Remark
0	X0、 Y0、 Z0	When A, B, C end is low level, output end X, Y, Z outputs the signals inputted by X0, Y0, Z0.
1	X1、 Y1、 Z1	When A, B, C end is high level, output end X, Y, Z outputs the signals inputted by X1, Y1, Z1.

Note: in the circuit, part of input pins are not used, A, B, C control end is controlled by LOOP control circuit. When in standby status, LOOP_DECODER_C is high level, when power on, LOOP_DECODER_C is low level.

3.5.3 function introduction to TSB41AB1

1. description

The TSB41AB1 provides the digital and analog transceiver functions needed to implement a one-port node in a cable-based IEEE 1394 network. The cable port incorporates one differential line transceiver. The transceiver includes circuitry to monitor the line conditions as needed for determining connection status, for initialization and arbitration, and for packet reception and transmission. The TSB41AB1 is designed to interface with a link layer controller (LLC).

The TSB41AB1 requires only an external 24.576-MHz crystal as a reference. An external clock may be provided instead of a crystal. An internal oscillator drives an internal phase-locked loop (PLL). This reference signal is internally divided to provide the clock signals used to control transmission of the outbound encoded strobe and data information. The power-down (PD) function, when enabled by asserting the PD terminal high, stops operation of the PLL.

The TSB41AB1 supports an optional isolation barrier between itself and its LLC. When the ISO input terminal is tied high, the LLC interface outputs behave normally. When the ISO terminal is tied low, internal differentiating logic is enabled, and the outputs are driven such that they can be coupled through a capacitive or transformer galvanic isolation barrier as described in Annex J of IEEE Std 1394-1995 and in IEEE 1394a-2000 (section 5.9.4) (hereinafter referred to as Annex J type isolation). To operate with TI bus holder isolation the ISO terminal on the PHY must be high.

Data bits to be transmitted through the cable port are received from the LLC on two, four or eight parallel paths (depending on the requested transmission speed) and are latched internally in the TSB41AB1 in synchronization with the 49.152-MHz system clock. These bits are combined serially, encoded, and transmitted at 98.304, 196.608, or 393.216 Mb/s (referred to as S100, S200, and S400 speeds, respectively) as the outbound data-strobe information stream. During transmission, the encoded data information is transmitted differentially on the TPB cable pair, and the encoded strobe information is transmitted differentially on the TPA cable pair.

During packet reception the TPA and TPB transmitters of the receiving cable port are disabled, and the receivers for that port are enabled. The encoded data information is received on the TPA cable pair, and the encoded strobe information is received on the TPB cable pair. The received data-strobe information is decoded to recover the receive clock signal and the serial data bits. The serial data bits are split into two-, four-, or eight-bit parallel streams (depending upon the indicated receive speed), resynchronized to the local 49.152-MHz system clock and sent to the associated LLC.

Both the TPA and TPB cable interfaces incorporate differential comparators to monitor the line states during initialization and arbitration. The outputs of these comparators are used by the internal logic to determine the arbitration status. The TPA channel monitors the incoming cable common-mode voltage. The value of this common-mode voltage is used during arbitration to set the speed of the next packet transmission. In addition, the TPB channel monitors the incoming cable common-mode voltage on the TPB pair for the presence of the remotely supplied twisted-pair bias voltage.

The TSB41AB1 provides a 1.86-V nominal bias voltage at the TPBIAS terminal for port termination. This bias voltage, when seen through a cable by a remote receiver, indicates the presence of an active connection. This bias voltage source must be stabilized by an external filter capacitor of 1 μ F. TPBIAS is typically $V_{DD} - 0.2$ V when the port is not connected to another node.

The line drivers in the TSB41AB1 operate in a high-impedance current mode, and are designed to work with external 112- Ω line-termination resistor networks in order to match the 110- Ω cable impedance. One network is provided at each end of a twisted-pair cable. Each network is composed of a pair of series-connected 56- Ω resistors. The midpoint of the pair of resistors that is directly connected to the twisted-pair-A terminals is connected to its corresponding TPBIAS voltage terminal. The midpoint of the pair of resistors that is directly connected to the twisted-pair-B terminals is coupled to ground through a parallel R-C network with recommended values of 5 k Ω and 220 pF. The values of the external line termination resistors are designed to meet IEEE Std 1394-1995 when connected in parallel with the internal receiver circuits. An external resistor connected between the R0 and R1 terminals sets the driver output current, along with other internal operating currents. This current-setting resistor has a value of 6.34 k Ω \pm 1.0%.

When the power supply of the TSB41AB1 is off while the twisted-pair cables are connected, the TSB41AB1 transmitter and receiver circuitry presents a high impedance to the cable and does not load the TPBIAS voltage at the other end of the cable. Fail-safe circuitry blocks any leakage path from the port back to the device powerplane.

The TESTM, SE, and SM terminals are used to set up various manufacturing test conditions. For normal operation, the TESTM terminal should be connected to VDD through a 1-k Ω resistor, SE should be tied to ground through a 1-k Ω resistor, and SM should be connected directly to ground.

Four package terminals are used as inputs to set the default value for four configuration status bits in the self-ID packet, and are tied high through a 1-k Ω resistor or hardwired low as a function of the equipment design. The PC0-CPC2 terminals are used to indicate the default power-class status for the node (the need for power from the cable or the ability to supply power to the cable). See Table 9 for power-class encoding. The C/LKON terminal is used as an input to indicate that the node is a contender for either isochronous resource manager (IRM) or for bus manager (BM).

The TSB41AB1 supports suspend/resume as defined in the IEEE 1394a-2000 specification. The suspend mechanism allows pairs of directly connected ports to be placed into a low-power state (suspended state) while maintaining a port-to-port connection between bus segments. While in the suspended state, a port is unable to transmit or receive data transaction packets. However, a port in the suspended state is capable of detecting connection status changes and detecting incoming TPBIAS. When the port of the TSB41AB1 is suspended, all circuits except the band gap reference generator and bias detection circuit is powered down, resulting in significant power savings. For additional details of suspend/resume operation see IEEE 1394a-2000. The use of suspend/resume is recommended for new designs.

The port transmitter and receiver circuitry is disabled during power down (when the PD input terminal is asserted high), during reset (when the RESET input terminal is asserted low), when no active cable is

connected to the port, or when controlled by the internal arbitration logic. The TPBIAS output is disabled during power down, during reset, or when the port is disabled as commanded by the LLC.

The cable-not-active (CNA) output terminal (64-terminal PAP package only) is asserted high when there are no twisted-pair cable ports receiving incoming bias (that is, they are either disconnected or suspended), and can be used along with LPS to determine when to power down the TSB41AB1. The CNA output is not debounced. When the PD terminal is asserted high, the CNA detection circuitry is enabled (regardless of the previous state of the ports) and a pulldown is activated on the RESET terminal so as to force a reset of the TSB41AB1 internal logic.

The LPS (link power status) terminal works with the C/LKON terminal to manage the power usage in the node. The LPS signal from the LLC is used in conjunction with the LCtrl bit (see Table 1 and Table 2 in the Application Information section) to indicate the active/power status of the LLC. The LPS signal is also used to reset, disable, and initialize the PHY-LLC interface (the state of the PHY-LLC interface is controlled solely by the LPS input, regardless of the state of the LCtrl bit).

The LPS input is considered inactive if it remains low for more than 2.6 μ s and is considered active otherwise. When the TSB41AB1 detects that LPS is inactive, it places the PHY-LLC interface into a low-power reset state in which the CTL and D outputs are held in the logic zero state and the LREQ input is ignored; however, the SYSCLK output remains active. If the LPS input remains low for more than 26 μ s, the PHY-LLC interface is put into a low-power disabled state in which the SYSCLK output is also held inactive. The PHY-LLC interface is also held in the disabled state during hardware reset. The TSB41AB1 continues the necessary repeater functions required for normal network operation regardless of the state of the PHY-LLC interface. When the interface is in the reset or disabled state and LPS is again observed active, the PHY initializes the interface and returns it to normal operation.

When the PHY-LLC interface is in the low-power disabled state, the TSB41AB1 automatically enters a low-power mode if the port is inactive (disconnected, disabled, or suspended). In this low-power mode, the TSB41AB1 disables its internal clock generators and also disables various voltage and current reference circuits depending on the state of the port (some reference circuitry must remain active in order to detect new cable connections, disconnections, or incoming TPBIAS, for example). The lowest power consumption (the ultralow-power sleep mode) is attained when the port is either disconnected, or disabled with the port interrupt enable bit cleared. The TSB41AB1 exits the low-power mode when the LPS input is asserted high or when a port event occurs which requires that the TSB41AB1 become active in order to respond to the event or to notify the LLC of the event (for example, incoming bias is detected on a suspended port, a disconnection is detected on a suspended port, a new connection is detected on a nondisabled port, etc.). The SYSCLK output becomes active (and the PHY-LLC interface is initialized and becomes operative) within 7.3 ms after LPS is asserted high when the TSB41AB1 is in the low-power mode.

The PHY uses the C/LKON terminal to notify the LLC to power up and become active. When activated, the C/LKON signal is a square wave of approximately 163-ns period. The PHY activates the C/LKON output when the LLC is inactive and a wake-up event occurs. The LLC is considered inactive when either the LPS

input is inactive, as described above, or the LCtrl bit is cleared to 0. A wake-up event occurs when a link-on PHY packet addressed to this node is received, or when a PHY interrupt occurs. The PHY deasserts the C/LKON output when the LLC becomes active (both LPS active and the LCtrl bit set to 1). The PHY also deasserts the C/LKON output when a bus reset occurs unless a PHY interrupt condition exists which would otherwise cause C/LKON to be active.

2. FEATURE

Fully Supports Provisions of IEEE 1394-1995 Standard for High Performance Serial Bus. and IEEE 1394a-2000

Fully Interoperable With FireWire and i.LINK Implementation of IEEE Std 1394

Fully Compliant With OpenHCI Requirements

Provides One IEEE 1394a-2000 Fully Compliant Cable Port at 100/200/400 Megabits Per Second (Mbits/s)

Full IEEE 1394a-2000 Support Includes: Connection Debounce, Arbitrated Short Reset, Multispeed Concatenation, Arbitration Acceleration, Fly-By Concatenation, Port Disable/Suspend/Resume

Register Bits Give Software Control of Contender Bit, Power Class Bits, Link Active Control Bit, and IEEE 1394a-2000 Features

IEEE 1394a-2000 Compliant Common Mode Noise Filter on Incoming TPBIAS

Extended Resume Signaling for Compatibility With Legacy DV Devices, and Terminal- and Register-Compatibility With TSB41LV01, Allow Direct Isochronous Transmit to Legacy DV Devices With Any Link Layer Even When Root

Power-Down Features to Conserve Energy in Battery Powered Applications Include: Automatic Device Power Down During Suspend, Device Power-Down Terminal, Link Interface Disable via LPS, and Inactive Ports Powered Down

Failsafe Circuitry Senses Sudden Loss of Power to the Device and Disables the Port to Ensure That the Device Does Not Load TPBIAS of the Connected Device and Blocks Any Leakage Path From the Port Back to the Device Power Plane

Software Device Reset (SWR)

Industry Leading Low Power Consumption

Ultralow-Power Sleep Mode

Cable Power Presence Monitoring

Cable Ports Monitor Line Conditions for Active Connection to Remote Node

Data Interface to Link-Layer Controller Through 2/4/8 Parallel Lines at 49.152 MHz

Interface to Link Layer Controller Supports Low Cost TI Bus-Holder Isolation and Optional Annex J Electrical Isolation

Interoperable With Link-Layer Controllers Using 3.3 V

Single 3.3-V Supply Operation

Low-Cost 24.576-MHz Crystal Provides Transmit, Receive Data at 100/200/400 Mbits/s, and Link-Layer Controller Clock at 49.152 MHz

Low-Cost High-Performance 48/64-Pin TQFP (PHP/PAP) Thermally Enhanced Packages Increase Thermal Performance by up to 210%

Meets Intel Mobile Power Guideline 2000

3 . PIN DESCRIPTION

PIN	Symbol	I/O	Description

48	LREQ	I	LLC request input.

3.5.4 function introduction to M13S128168A

1. DESCRIPTION

2M x 16 Bit x 4 Banks

Double Data Rate SDRAM

2. FATUER

JEDEC Standard

Internal pipelined double-data-rate architecture, two data access per clock cycle

Bi-directional data strobe (DQS)

On-chip DLL

Differential clock inputs (CLK and CLK)

DLL aligns DQ and DQS transition with CLK transition

Quad bank operation

CAS Latency : 3

Burst Type : Sequential and Interleave

Burst Length : 2, 4, 8

All inputs except data & DM are sampled at the rising edge of the system clock(CLK)

Data I/O transitions on both edges of data strobe (DQS)

DQS is edge-aligned with data for reads; center-aligned with data for WRITE

Data mask (DM) for write masking only

VDD = 2.375V ~ 2.75V, VDDQ = 2.375V ~ 2.75V

Auto & Self refresh

7.8us refresh interval

SSTL-2 I/O interface

66pin TSOPII package

3 . PIN DESCRIPTION

PIN	Symbol	Description
1	VDD	Supply Voltage
2	DQ0	Data-in/Data-out
3	VDDQ	Supply Voltage for DQ
4	DQ1	Data-in/Data-out
5	DQ2	Data-in/Data-out
6	VSSQ	Ground for DQ
7	DQ3	Data-in/Data-out
8	DQ4	Data-in/Data-out

66	VSS	Ground

3.5.5 Function introduction to CD4052

CD4052 is a 2-group 4-channel data selection device and mainly used in the input selection of audio and video signals in DVD recorder. Each pin function is shown as follows:

Pin	Name	Function	I/O
1、 2、 4、 5	Y0-Y3	Y signal input	I
11、 12、 14、 15	X0-X3	X signal input	I
3、 13	Y	Y signal output	O
6	INH	Two groups have no output when two ends are high level	I
7	VEE	-12V power (grounding)	
8	VSS	ground	
16	VDD	+5V power	
9、 10	B、 A	Strobe signal	I
13	X	X signal output	O

A、 signal strobe condition:

A(10)	B(9)	X(13)	Y(3)	Remark
-------	------	-------	------	--------

0	0	X0	Y0	X/Y outputs signals inputted by X0/Y0
0	1	X1	Y1	X/Y outputs signals inputted by X1/Y1
1	0	X2	Y2	X/Y outputs signals inputted by X2/Y2
1	1	X3	Y3	X/Y outputs signals inputted by X3/Y3

Note: in the circuit, part of input pins are not used, A, B control end is controlled by main chip. When main chip is switching input signal source, it will control signals to make 4052 perform input source selection.

3.5.6 function introduction to TVP5150A

1. DESCRIPTION

The TVP5150A device is an ultralow power NTSC/PAL/SECAM video decoder. Available in a space saving 32-pin TQFP package, the TVP5150A decoder converts NTSC, PAL, and SECAM video signals to 8-bit ITU-R BT.656 format. Discrete syncs are also available. The optimized architecture of the TVP5150A decoder allows for ultralow-power consumption. The decoder consumes 115 mW of power in typical operation and consumes less than 1 mW in power-down mode, considerably increasing battery life in portable applications. The decoder uses just one crystal for all supported standards. The TVP5150A decoder can be programmed using an I2C serial interface. The decoder uses a 1.8-V supply for its analog and digital supplies, and a 3.3-V supply for its I/O.

The TVP5150A decoder converts baseband analog video into digital YCbCr 4:2:2 component video. Composite and S-video inputs are supported. The TVP5150A decoder includes one 9bit analog-to-digital converter (ADC) with 2x sampling. Sampling is ITU-R BT.601 (27.0 MHz, generated from the 14.31818-MHz crystal or oscillator input) and is line-locked. The output formats can be 8-bit 4:2:2 or 8-bit ITU-R BT.656 with embedded synchronization.

The TVP5150A decoder utilizes Texas Instruments patented technology for locking to weak, noisy, or unstable signals. A Genlock/real-time control (RTC) output is generated for synchronizing downstream video encoders.

Complementary 4line adaptive comb filtering is available for both the luma and chroma data paths to reduce both cross-luma and cross-chroma artifacts; a chroma trap filter is also available.

Video characteristics including hue, contrast, brightness, saturation, and sharpness may be programmed using the industry standard I2C serial interface. The TVP5150A decoder generates synchronization, blanking, lock, and clock signals in addition to digital video outputs. The TVP5150A decoder includes methods for advanced vertical blanking interval (VBI) data retrieval. The VBI data processor slices, parses, and performs error checking on teletext, closed caption, and other data in several formats.

The TVP5150A decoder detects copy-protected input signals according to the Macrovision. standard and detects Type 1, 2, 3, and colorstripe pulses.

The main blocks of the TVP5150A decoder include:

- Robust sync detector
- ADC with analog processor
- Y/C separation using 4-line adaptive comb filter
- Chrominance processor
- Luminance processor
- Video clock/timing processor and power-down control
- Output formatter
- I2C interface
- VBI data processor
- Macrovision. detection for composite and S-video

2. Features

Accepts NTSC (M, 4.43), PAL (B, D, G, H, I, M, N), and SECAM (B, D, G, K, K1, L) video data

Supports ITU-R BT.601 standard sampling

High-speed 9-bit ADC

Two composite inputs or one S-video input

Fully differential CMOS analog preprocessing channels with clamping and automatic gain control

(AGC)for best signal-to-noise (S/N) performance

Ultralow power consumption: 115 mW typical

32-pin TQFP package

Power-down mode: <1 mW

Brightness, contrast, saturation, hue, and sharpness control through I2C

Complementary 4-line (3-H delay) adaptive comb filters for both cross-luminance and

cross-chrominance noise reduction

Patented architecture for locking to weak, noisy, or unstable signals

Single 14.31818-MHz crystal for all standards

Internal phase-locked loop (PLL) for line-locked clock and sampling

Subcarrier Genlock output for synchronizing color subcarrier of external encoder

Standard programmable video output format:

ITU-R BT.656, 8-bit 4:2:2 with embedded syncs

8-bit 4:2:2 with discrete syncs

Macrovision®copy protection detection

Advanced programmable video output formats:

- 2x oversampled raw VBI data during active video

- Sliced VBI data during horizontal blanking or active video

VBI modes supported

- Teletext (NABTS, WST)
- Closed-caption decode with FIFO, and extended data services (EDS)
- Wide screen signaling, video program system, CGMS, vertical interval time code
- Gemstar 1x/2x electronic program guide compatible mode
- Custom configuration mode that allows the user to program the slice engine for unique VBI data

signals

Power-on reset

3. PIN DESCRIPTION

PIN	Symbol	I/O	Description
1	AIP1A	I	Analog input. Connect to the video analog input via 0.1- μ F capacitor.
2	AIP1B	I	
3	PLL_AGND	I	PLL ground.
4	PLL_AVDD	I	PLL power supply
5	XTAL1/OSC	I	External clock reference.
6	XTAL2	O	External clock reference.
7	AGND	I	Substrate. Connect to analog ground.
8	RESETB	I	Active-low reset.
9	PCLK/SCLK	O	System clock at either 1x or 2x the frequency of the pixel clock.
10	IO_DVDD	I	Digital supply.
11	YOUT7/I2CSEL	I/O	MSB of output decoded ITU-R BT.656 output/YCbCr 4:2:2 output. Determines address for I2C
12	YOUT6	I/O	Output decoded ITU-R BT.656 output/YCbCr 4:2:2 output with discrete sync.
13	YOUT5		
14	YOUT4		
15	YOUT3		
16	YOUT2		
17	YOUT1		
18	YOUT0		
19	DGND	I	Digital ground
20	DVDD	I	Digital supply
21	SCL	I/O	I2C serial clock
22	SDA	I/O	I2C serial data
23	FID/GLCO	O	Odd/even field indicator or vertical lock indicator.

			General-purpose control logic.
24	VSYNC/PAL1	O	Vertical synchronization signal PAL line indicator or horizontal lock indicator
25	HSYNC	O	Horizontal synchronization signal
26	AVID	O	Active video indicator.
27	INTREQ	I/O	INTREQ: Interrupt request output. GPCL: General-purpose control logic.
28	PDN	I	Power-down terminal
29	REFP	I	A/D reference ground.
30	REFM	I	A/D reference ground.
31	CH_AGND	O	Analog ground
32	CH_AVDD	O	Analog supply

3.5.7 function introduction to 16316-52

1. DESCRIPTION

FRONT PANEL CONTROLLER WITH POWER CONTROL FUNCTION The 16316-52 is a FIP (Fluorescent Indicator Panel, or Vacuum Fluorescent Display) controller/driver that is driven on a 1/4 to 1/16 duty factor. It consists of 25 FIP, a display memory, a control circuit, a key scan circuit and a remote control decoder. Serial data is input to the 16316-52 through a 5-line serial interface which is fully hand-shake with the HOST. This FIP controller is ideal as a peripheral device for front panel control for DVD/VCD.

2. FEATURES

FIP controller/driver : 25 display output (1-segment and 24 digits to 24 segment and 1 digit)

Key scanning (3 X 16)

Stand-by control

Remote control code decoding with programmable custom code, support remote formats : N EC, RC5,

Kaisakyo, Sony 12 bit, Sony 15 bit

User configurable wake-up code (8 key-code, 8 remote code)

Dimming control

High-voltage output

User data storage (32 bytes)

LED ports (4 chs., 20 mA max)

Serial interface

Fully compatible with C-CUBE ZIVA Font Panel (MIS) protocol.

3. PIN DESCRIPTION

PIN	Symbol	I/O	Description
1	Vdd		Logic Power
2	XT1		Oscillator Circuit input (Sub-clock)
3	XT2		Oscillator Circuit output(Sub-clock)
4	RESET		Reset
5	RDY_FM		Front Panel Microcontroller Ready
6	ATN_FM		Attention by Front Micom
7	#HOST_RST	O	The reset output to main processor
8	SCK	I	Clock input
9	D_FM	O	Data Output
10	D_HOST	I	The Host transmits 8-bit serial data with LSB first.
11	SCK1	I	Clock input
12	POWER_FAIL	I	Power control pin to control the main power
13	IR	I	Connect to IR receiver module
14	FIP0	O	FIP Driving Pins

50	X1	I	Oscillator Circuit input (main clock)
51	X2	O	Oscillator Circuit output (main clock)
52	VSS	I	Ground

3.5.8 function introduction to SN74LVC16373

1. Description

This 16-bit transparent D-type latch is designed for 2.7-V to 3.6-V VCC operation. The SN74LVC16373 is particularly suitable for implementing buffer registers, I/O ports, bidirectional bus drivers, and working registers. It can be used as two 8-bit latches or one 16-bit latch. When the latch-enable (LE) input is high, the Q outputs follow the data (D) inputs. When LE is taken low, the Q outputs are latched at the levels set up at the D inputs. A buffered output-enable (OE) input can be used to place the eight outputs in either a normal logic state (high or low logic levels) or a high-impedance state. In the high-impedance state, the outputs neither load nor drive the bus lines significantly. The high-impedance state and the increased drive provide the capability to drive bus lines without need for interface or pullup components. OE does not affect internal operations of the latch. Old data can be retained or new data can be entered while the outputs are in the

high-impedance state. To ensure the high-impedance state during power up or power down, OE should be tied to VCC through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver. Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

2. Feature

Member of the Texas Instruments Widebus[®] Family

EPIC[™] (Enhanced-Performance Implanted CMOS) Submicron Process

Typical VOLP (Output Ground Bounce) < 0.8 V at VCC = 3.3 V, TA = 25[°] C

Typical VOHV (Output VOH Undershoot) > 2 V at VCC = 3.3 V, TA = 25[°] C

Latch-Up Performance Exceeds 250 mA Per JEDEC Standard JESD-17

Bus Hold on Data Inputs Eliminates the Need for External Pullup/Pulldown Resistors

Package Options Include Plastic 300-mil Shrink Small-Outline (DL) and Thin Shrink Small-Outline (DGG) Packages DGG OR DL PACKAGE

3. PIN DESCRIPTION

3.5.9 function introduction to MSP 34x5G

1. Description

The MSP 34x5G family of single-chip Multistandard Sound Processors covers the sound processing of

all analog TV standards worldwide, as well as the NICAM digital sound standards. The full TV sound processing, starting with analog sound IF signal-in, down to processed analog AF-out, is performed in a single chip. Figure 1–1 shows a simplified functional block diagram of the MSP 34x5G.

This new generation of TV sound processing ICs now includes versions for processing the multichannel television sound (MTS) signal conforming to the standard recommended by the Broadcast Television Systems Committee (BTSC). The DBX noise reduction is performed alignment-free.

Other processed standards are the Japanese FM-FM multiplex standard (EIA-J) and the FM-Stereo-Radio standard.

Current ICs have to perform adjustment procedures in order to achieve good stereo separation for BTSC and EIA-J. The MSP 34x5G has optimum stereo performance without any adjustments.

All MSP 34xxG versions are pin compatible to the MSP 34xxD. Only minor modifications are necessary to adapt a MSP 34xxD controlling software to the MSP 34xxG. The MSP 34x5G further simplifies controlling software. Standard selection requires a single I2C transmission only.

2. PIN DESCRIPTION

PIN	Symbol	I/O	Description
1	AVSUP	I	Analog power supply +5 V
2	ANA_IN1+	I	IF input 1
3	ANA_IN-	I	IF common

3.5.10 function introduction to TPS2041A

1. Description

The TPS2041A through TPS2044A and TPS2051A through TPS2054A power-distribution switches are intended for applications where heavy capacitive loads and short circuits are likely to be encountered. These devices incorporate 80-mW N-channel MOSFET high-side power switches for power-distribution systems that require multiple power switches in a single package. Each switch is controlled by an independent logic enable input. Gate drive is provided by an internal charge pump designed to control the power-switch rise times and

fall times to minimize current surges during switching. The charge pump requires no external components and allows operation from supplies as low as 2.7 V.

When the output load exceeds the current-limit threshold or a short is present, these devices limit the output current to a safe level by switching into a constant-current mode, pulling the overcurrent (OCx) logic output low. When continuous heavy overloads and short circuits increase the power dissipation in the switch, causing the junction temperature to rise, a thermal protection circuit shuts off the switch to prevent damage. Recovery from a thermal shutdown is automatic once the device has cooled sufficiently. Internal circuitry ensures the switch remains off until valid input voltage is present. These power-distribution switches are designed to current limit at 0.9 A.

2. FEATURE

80-mW High-Side MOSFET Switch

500 mA Continuous Current Per Channel

Independent Thermal and Short-Circuit Protection With Overcurrent Logic Output

Operating Range . . . 2.7 V to 5.5 V

CMOS- and TTL-Compatible Enable Inputs

2.5-ms Typical Rise Time

Undervoltage Lockout

10 mA Maximum Standby Supply Current for Single and Dual (20 mA for Triple and Quad)

Bidirectional Switch

Ambient Temperature Range, 0 ° C to 85 ° C

ESD Protection

UL Listed "C File No. E169910

3. PIN DESCRIPTION

PIN	Symbol	I/O	Description
1	GND	I	Ground
2	IN	I	Input voltage
3	IN	I	Input voltage
4	#EN	I	Enable input
5	#OC	O	Over current
6	OUT	I	Power-switch
7	OUT	I	
8	OUT	I	

3.5.11 function introduction to LP2995

1. Description

The LP2995 linear regulator is designed to meet the JEDEC STL-2 and SSTL-3 specifications for termination of DDRSDRAM. The device contains a high-speed operational amplifier to provide excellent response to load transients. The output stage prevents shoot through while delivering 1.5A continuous current and transient peaks up to 3A in the application as required for DDR-SDRAM termination. The LP2995 also incorporates a VSENSE pin to provide superior load regulation and a VREF output as a reference for the chipset and DDR DIMMS.

2. Features

- Low output voltage offset
- Works with +5v, +3.3v and 2.5v rails
- Source and sink current
- Low external component count
- No external resistors required
- Linear topology
- Available in SO-8, PSOP-8 or LLP-16 packages
- Low cost and easy to use

3. PIN DESCRIPTION

PIN	Symbol	Description
1	NC	No internal connection.
2	GND	Ground
3	VSENSE	Feedback pin for regulating VTT .
4	VREF	Buffered internal reference voltage of VDDQ/2.
5	VDD	Input for internal reference equal to VDDQ/2.
6	AVIN	Analog input pin.
7	PVIN	Power input pin.
8	VTT	Output voltage for connection to termination resistors.

3.5.12 function introduction to FSDM0565R

1. Description

The FSDM0565R is specially designed for an off-line Switched mode power supply (SMPS). This device is a current mode PWM controller combined with a high voltage power SenseFET in a single package using BCDMOS technology. The PWM controller includes integrated fixed frequency oscillator, under voltage

lockout, leading edge blanking (LEB), optimized gate driver, internal soft start, temperature compensated precise current sources for a loop compensation and self protection circuitry. Compared with discrete MOSFET and PWM controller solution, it can reduce total cost, component count, size and weight simultaneously increasing efficiency, productivity, and system reliability. This device is well suited for cost effective design of LCD monitor adapter.

2. Features

Precise fixed operating frequency (70kHz)

Low power consumption (under 1W) at 265VAC with 0.5W load with a burst-mode operation

Pulse by pulse current limit

Abnormal over current protection (auto restart mode)

Over voltage protection (auto restart mode)

Over load protection (auto restart mode)

Thermal shutdown (auto restart mode)

Under voltage lockout

Fully avalanche rated and 100% tested senseFET

Internal soft start

3. PIN DESCRIPTION

PIN	Symbol	Description
1	Drain	This pin is the high voltage power SenseFET drain.
2	Ground	This pin is the control ground and the SenseFET source.
3	Vcc	This pin is the positive supply voltage input.
4	Feedback	This pin is internally connected to the inverting input of the PWM comparator.
5	Nc	
6	Vstr	This pin is connected directly to the high voltage DC link.

3.5.13 Function introduction to M41T80

1. DESCRIPTION

M41T80 is the latest serial real-time clock chip, and used in batter power supply. M41T80 includes I2C jack and warning function of 400KHz, special 32KHz output, when in low power mode or clock generator reference input, the micro controller of 32Khz is very useful. The warning function of M41T80 includes repeat mode, from once in a year to once in a second. The programmable wave function may perform program from 1Hz to 32KHz, power classification of 2, when voltage power supply is normal, 32KHz output is continuous and may be screen-shielded by software.

2. Features

2.0 TO 5.5V CLOCK OPERATING VOLTAGE

COUNTERS FOR TENTHS/HUNDREDTHS OF SECONDS, SECONDS, MINUTES, HOURS, DAY, DATE, MONTH, YEAR, and CENTURY

SERIAL INTERFACE SUPPORTS I2C BUS (400KHz)

PROGRAMMABLE ALARM and INTERRUPT FUNCTION

LOW OPERATING CURRENT OF 200µA

OPERATING TEMPERATURE OF -40 TO 85 ° C

3. PIN DESCRIPTION

PIN	Symbol	I/O	Description
1	XI	I	Crystal oscillator input
2	XO	O	Crystal oscillator output
3	F32K	O	32KHz square wave output
4	VSS	I	Ground
5	SDA	I/O	Serial data input/output
6	SCL	I	Serial clock input
7	IRQ	O	Interrupt / Output Driver / Square Wave (Open Drain)
8	VCC	I	Supply voltage

3.5.14 function introduction to EM6353

1. Description

The EM6353 is an ultra-low current reset circuit available in a large variety of configurations and very small packages for maximum flexibility in all end-applications up to 125° C and using power supplies between 1.5V and 5.5V.

This circuit monitors the supply voltage of any electronic system, and generates the appropriate reset signal after a fixed reset timeout period. The threshold defines the minimum allowed voltage which guarantees the good functionality of the system. When VDD rises above VTH, the output remains active for an additional delay time. This allows the system to stabilize before getting fully active. The EM6353 features three output types: active-low pushpull, active-low open-drain and active-high push-pull. Small SC70-5L and SOT23-3L packages as well as ultra-low supply current of 2.9µ A make the EM6353 an ideal choice for portable and battery-operated devices.

2. Features

200ms reset timeout period (25ms on request)

Ultra-low supply current of 2.9µ A (VDD=3.3V)

Operating temperature range: -40° C to +125°C

± 1.5% reset threshold accuracy

11 reset threshold voltages VTH: 4.63V, 4.4V, 3.08V, 2.93V, 2.63V, 2.2V, 1.8V, 1.66V, 1.57V, 1.38V, 1.31V

3 reset output options:

Active-low RESET push-pull

Active-low RESET open-drain

Active-high RESET push-pull

No external components

Immune to short negative VDD transients

Guaranteed Reset valid down to 0.8V

Threshold hysteresis: 2.1% of VTH

Very small SOT23-3L and SC70-5L packages

3. PIN DESCRIPTION

PIN	Symbol	I/O	Description
1	NC		
2	VDD	I	Power supply
3	NC		
4	GND	I	Ground
5	RESET	O	Active-low RESET output.

3.5.15 function introduction to KA5H0380R

1. Description

The Fairchild Power Switch(FPS) product family is specially designed for an off-line SMPS with minimal external components. The Fairchild Power Switch(FPS) consist of high voltage power SenseFET and current mode PWM IC. Included PWM controller features integrated fixed frequency oscillator, under voltage lock-out, leading edge blanking, optimized gate turn-on/turn-off driver, thermal shutdown protection, over voltage protection, and temperature compensated precision current sources for loopcompensation and fault protection circuitry. Compared to discrete MOSFET and PWM controller or RCC solution, a Fairchild Power Switch(FPS) can reduce total component count, design size, weight and at the same time increase efficiency, productivity, and system reliability. It has a basic platform well suited for cost effective design

2.Features

Precision fixed operating frequency (100/67/50kHz)

Low start-up current(typ. 100uA)

Pulse by pulse current limiting
 Over current protection
 Over voltage protecton (Min. 25V)
 Internal thermal shutdown function
 Under voltage lockout
 Internal high voltage sense FET
 Auto-restart mode

3. PIN DESCRIPTION

PIN	Symbol	I/O	Description
1	GND	I	Ground
2	DRAIN	O	Drain
3	VCC	I	Power supply
4	FB	I	Feedback

3.5.16 function introduction to 74HC/HCT14

1. Description

The 74HC/HCT14 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL).

They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT14 provide six inverting buffers with Schmitt-trigger action. They are capable of transforming slowly changing input signals into sharply defined, jitter-free output signals.

2. FEATURES

Output capability: standard ICC category: SSI

3. PIN DESCRIPTION

PIN	Symbol	I/O	Description
1, 3, 5, 9, 11, 13	1A to 6A	I	Data inputs
2, 4, 6, 8, 10, 12	1Y to 6Y	O	Data outputs
7	GND	I	Ground (0 V)
14	VCC	I	Positive supply voltage

Chapter Four

Disassembly and Assembly Process

DVD players manufactured in BBK are largely identical but with minor differences and are mainly composed of loader components, control panel components, decode and servo board components, power board components, power amplifier board components, MIC board components and AV board components. In order to speed up the compilation of “Service Manual”, we shall not give repeat explanation to model with minor differences in chapter four “Disassembly and Assembly Process” for the later compiled service manuals. For disassembly and assembly process in this chapter, please refer to chapter 4 of “DK1005S Service Manual” or “DK1020S Service” .

The pictures of this model are shown as follows:
